The guy could be wrong about the modding of the 2006. If you want, check the model number. It should be 20-145A or 20-145. (The 20-145 is an old model, the 145A included an on/off switch for the lighted display while the 145 is for a dimmer.) Anything other than the above may not be modifiable.

Jerry

Fr> Frank V

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

MA>

Hi, Matt...
Ham radio conventions may yield something. A single channel receiver I got from a scan club meeting was a Plectron. The thing is great. All I had to do was change a crystal. It also had two reed detectors, which I modified to respond to the appropriate tones. Apparently, the Plectrons are like weeds at some conventions.

4604. Re: Moto Walkie Talkie Freqs

Newsgroup: rec.radio.scanner
Date: 1994-06-04 03:33:49 UTC
From: jwcooper@violet.ccit.arizona.edu
Message-ID: <1994Jun3.203349.1@violet.ccit.arizona.edu>
Source record: 273563

The walkie talkies used by movie and TV crews may be on locally licensed, or itenerate, business frequencies in virtually any band. But they may also be on frequencies allocated to the Special Industrial Motion Picture Radio Service, as specified in Title 47, US Code of Federal Regulation, Part 90.70; and, if the crew is associated with an actual TV station, they may be using Relay Press Radio Service frequencies (47 CFR, 90.71) and/or Broadcast Remote Pickup frequencies (47 CFR, 74.402)

Title 47 of the Code of Federal Regulation is the actual governing regulation for the FCC. The CFR should be avalible at most larger libraries. Here there are copies in the local law library, the main campus library, and the main branch of the public library.

4605. Radio Shack bashing!

I've heard many things both ways about Radio Shack and their products. I was wondering what was the basis behind this? Many people seem extremely pleased about Radio Shack's products/support/salespeople. Yet other people seem to absolutely hate Radio Shack. There doesn't seem to be much in the middle. I'm not saying this to support or bash Radio Shack, I'm just wondering why this is?
I personally have noticed that unlike most stores, Radio Shack is one of the few places that the people mention how the salesmen acted. If this is because it is one of the few places that the people help, or try to explain, or if it is because of pushy salespeople I'd like to know.

P.S. I'm not just referring to scanners either.

-Thanks

Layne

4606. wanted: computer controlled broadcast band receiver

Newsgroup: rec.radio.scanner
Date: 1994-06-04 05:46:27 UTC
From: hunter@work.nlm.nih.gov
Message-ID: <2sp4fj$csr@vixen.cso.uiuc.edu>
Source record: 273536
Cross-posted to: rec.radio.broadcasting,rec.radio.scanner

I have an application which requires the remote monitoring of a variety of broadcast stations. I basically need a moderately high fidelity broadcast band radio (AM/FM, US station spacing) that can be computer controlled. That is, I need to be able to turn the radio on and off, and set the reception frequency by PC. I also need a line-level audio output. I will probably be buying between 50 and 100 of these, so price is somewhat of an issue.

I have a couple of questions:

1. Are there "tuner" cards that fit into a PC chasis? What is their performance like in the rf environment inside a computer? Does anyone have any specific experience with them?

2. I am aware of the Kenwood RZ-1, which seems like overkill for this application. Does anyone know of any other radios that both tune the broadcast bands and have a serial port control?

Any other advice or input is welcome. Thanks!

Larry

457.55 Hawaiian Dredging Company -- Big Crane Frequency. This is the
construction company that is working on the huge Hale Koa
Expansion (a military recreation facility adjacent to
the existing Hale Koa Hotel, right next door to my hotel,
the Hilton Hawaiian Village, Tapa Tower). This frequency
took me a long time to puzzle out. I was so frustrated
because I could see all of the construction site, and
through binoculars I could see workers speak into walkie
talkies to talk with the big crane operator. I searched
460-470 VERY carefully, and nothing! Finally I plugged
in every IS frequency that my old Police Call listed!

464.1875 R Atlantis Submarine Phone Patch!! Much behind the scenes
radio traffic; From my hotel room on the 33rd floor,

I heard both sides of the phone patch on what should
have been just the "input" frequency: 469.1875.

464.675 R (* unknown business, but this was a fun frequency to listen
to the locals "talk story" -- I don't think I heard any
business transacted, just chatty gossip! Good fun! *)

860.1375 R Phone Patches -- Cindy from Motorola calling a customer,
other companies using the phone patch, and some non-English
languages.

OAHU PUBLIC SAFETY, heard from the 33rd floor of Hilton Hawaiian Village,
Tapa Tower:

154.68 test-1-2-3-4; ROOM BUG FREQUENCY on 5/31/94 at 9:45pm.
You got the money?
May I see your flight ticket, so I know you're not a cop.
Yeah, you're not a cop.
(* the prostitute never came out and asked the officer
directly: ARE YOU A COP? she just said lemme see you're
flight ticket, so I know you're not a cop!!! so this bust
will not be entrapment! *)
(* she goes to the bathroom and comes out, has him put on
a condom, but he says he's nervous, so he goes to the
bathroom, and when he comes out, the officers burst in
and arrest the prostitute! *)
(* they start counting all of the money that she had on her,
and they compare serial numbers on the marked money that
the officer gave her *)
(* then they started questioning her, with every word being
faithfully broadcast over this frequency!!! she gave her
real name, her street name, her address!!!! amazing that
the officers didn't shut down the transmitter before this!
anyway, this was the first time i have ever heard a room
bug over the scanner!! amazing stuff, eh? *)

OAHU TO NEIGHBOR ISLAND MOLOKAI AIRCRAFT FREQUENCIES:

Took a small DeHavilland Stol Twin Otter 300 propeller plane ride from
Honolulu International Airport on Oahu to Molokai Airport on Molokai.
I was able to sit right behind the cockpit and they left the doors ajar,
so I was able to copy the frequencies that they dialed into the radio.

Aloha Island Air was the carrier; it's a small division of Aloha Airlines.
I wonder which of these is their company frequency?

When I boarded the plane, these were the frequencies already showing:
121.9 118.1
131.3 121.4
114.8 116.1

During the taxi to the take-off position, the co-pilot changed some
of the frequencies, so these were the current operating freqs:
118.3 124.1
131.3 125.7
114.8 116.1

On the return flight later in the day, from Molokai to Honolulu,
they had these frequencies already dialed into the radio at take-off:
124.1 127.9
131.3 125.7
114.8 116.1

Finally, airborne and enroute to Oahu, the co-pilot changed the last
two frequencies to read:
119.1 118.1

phew!

before i left for hawaii, i programmed my bc200xlt with all of the federal
government & military "national" freqs, all of the fbi, secret service,
irs, ins, marshal, nis, osi, ... i filled all 200 channels on the dang
scanner, and just let it scan the first day -- nothing! so i had to PLENTY
of searching!

please post additions & corrections here on usenet.

thanks!

greg

4608. What is at this freq?

Just found this nice updated Disney list on Fidonet:

Date: 05-31-94 19:13:10
From: Bob Kozlarek
To: All
Subject: UPDATED DISNEY FREQ'S

Several weeks ago I posted a list of Walt Disney World
frequencies, and other associated frequencies in the Orlando
area. I've updated the list and added about 25 more. Authors and
contributors are for the most part unknown. I take no credit for
discovering them all, only for compiling and posting - enjoy!
Also, as posted previously, the people at Walt Disney World don't
take to visitors with scanners - be discrete!!

discussions on drive thru service windows.

i have heard the youngin's gabbing on their
headsets about people in line,their friends,
bosses etc. it can be quite entertaining 'specially
on friday and saturday nites. take your handheld
or mobile through the drive thru and see what they
say about you or the person you are with.

the headsets have a chat switch which enables them
to talk to each other without coming over the loud
speaker at the menu board....lucky for them...

i won't bore you with what they said about me when
i went through . if they do say something, wait until
you reach the last window (if two) and then repeat what
they said...it'll freakem'out...trust me on this one

: helped your McDonalds with your scanner?" thread! :-)

its not nearly as fun as driving up a 1300 foot hill with a modified 2 meter radio and a 160w amplifier and going on 157.57 and order 10 big mac's and having 300 mcdonalds make the same order for nobody.

just kidding. I've never done this but i just wonder if it would work if we had the right PL, 107.2? One time i did actually order with my ft-530 instead of talking into the menu speaker & they didnt even notice.

The diode is maybe 1/8" wide and 3/16" high and looks like a bullet
with two wires coming out of the base. These two wires are soldered
to the circuit board. Clip either one of the wires with sidecutters
(or a pair of sissors, or your nail clippers). Bend the other wire
by pushing sideways on the diode so the ends of the clipped wire
can't touch. Thats it!

4617. Frequencies for a think-speak hands-free mike?

Newsgroup: rec.radio.scanner
Date: 1994-06-04 17:00:20 UTC
From: chiun@pegasus.rutgers.edu
Message-ID: <Jun.4.13.00.20.1994.9942@pegasus.rutgers.edu>
Source record: 273557

I'm looking for the freqs for a hands-free mike, as I recently saw a performance by a speaker who used one of these devices to tell his stories while walking around the stage. My idea is to intercept his transmission in order to preserve it for posterity.

Any help is appreciated, please respond publicly for the benefit of others.

I would guess you are in California.. You might tell us the name of your cable service (or the one you want to monitor.) Cable TV services are all over the business bands.. I've got some listed in 856.0125-860.9875 MHz band, 460 MHz area, and the 151 MHz area.

: I've picked up a radio station (that isn't identifying) at 907.5375mhz. Could this be a very high harmonic or is it just a station not in my books?

Could it be someone on hold (listening to hold music) on one of the 900 MHz cordless phones? <grin>

Does it sound like a professional broadcast? It could be someone using 900 Mhz ham gear to broadcast.. Jammer?

It could be a lot of things.. I see a little band allocation for broadcasting in the 942 - 947 MHz range. The only other closest thing would be TV channel 69 way down, just below 806 MHz. I just can't imagine an image of that magnitude..

We have a similar thing here... an 0800 (toll free) number that you
can dial from anywhere in the country. You don't have to tell them
who you are, or where you got the information from. If you did, they
probably couldn't act on it.

I know a police officer here, he's told me they get the occasional
phone call from someone monitoring them, where the person has heard
a call that they're looking for a car, or person, and they've spotted them.

GL>oh... say... 30 seconds or so.

GL>Of course, this could be the start of the "Have you ever
GL>helped your McDonalds with your scanner?" thread! :-)

GL>Enlightenment, please?

One time I was at a McDonalds drive in monitoring the drive through discussions when on a seprate scanner I overheard a report of a holdup at the same Mcdonalds I was monitoring. Using great stealth I porcedded to work my way around the corner wherupon I noted a rather large, ugly induvidual with orange hair and a large protruding red nose with a GUN at the counter. He was demanding " Fill the Da** bag with happy meals or eat lead dogface!!" I snuck up behind the crazed clown and smacked him across his ugly pate with my trusty BC 200. needless to say he went down like a sack of cement. When the authorities arrived he was placed in chains and hauled off to the jail. One would think that I would receive the appreciation and adulation of all the patrons in the establishment but NO it seems that there were 2 birthday parties going on in the McDonalds at the time I brained Ronald and the children were traumatized by the events above.... Oh well just goes to show you that scanning and McDonalds don't mix.;>

4629. PRO-2026 with car antenna??

Newsgroup: rec.radio.scanner
Date: 1994-06-05 03:01:02 UTC
From: ROSS@NOVAX.LLNL.GOV
Message-ID: <ROSS-040692195650@lisaraip7.llnl.gov>
Source record: 273568

Now that the PRO 2026 is on sale for $150 at the shack (and cheaper by mailorder), can anybody tell me how well it works connected (with a tee) to a regular car antenna? It seems to be a mobile unit without any hole in the top to screw in a stick antenna.

How well does the unit work for a double conversion scanner? I can live with double conversion if the price is right. Did I also hear that if power is disconnected, the memory is wiped out?

Thanks for any info,

Gary

I'm using a 2026, with a 30-900 mhz cable tv splitter on the am/fm lead. I get some nasty intermod in the UHF area occasionally, but that's only when I'm in the shadow of the moutain where 90% of the pagers are in town. When that happens I switch to a 10" rubber ducky mounted inside the car.
It's been a good performer for me, but I live in a small town...

I hunted through my files and came up with a list of frequencies for Kansas City that were provided to me by Associated Radio of KC. Since there are about 100 frequencies on the list let me just hit some of the main ones.

KC Missouri police: 155.64 city-wide and various others in 154,155,156,159 bands.
KC Missouri fire: 154.13
KC Kansas police: 858.76, 859.76, 460.175, 460.375, 460.5 and others in the 450's and 460's.
KC Kansas fire: 153.77, and others in 154's
MO Highway Patrol: 42.06, 42.12 and others in 42's
Kansas Highway Patrol: 44.94, 45.18
MO sheriff: 155.37, 155.73, 155.79, 155.97 and others in 155's
Kansas sheriff: 39.58 and others in 39's
Ambulances: 465.525 and low 463's

I hope these will at least give you a starting point. I don't know how current these are and some may have gone to other bands by now. If you have the time, give Associated a call (913)-381-5900 or write them (See current ham magazines for their ad). They will ship you a current catalog for $2 or $3 and would probably include the frequency list if you request it. They have always been very good to deal with for me.

Hi Nicholas! :) I bought an AOR 900 1 year ago from Ace Communication in US.
The Frequency range is from 27.000 Mhz to 950.000 Mhz. You can scan, search,

priority channel, nice light that really lights up the display good in dark. Its small and not heavy. You can scan or search stuff like CB radios, your city department, Police, Fire Depts, Ambulance, Cordless Phones, and especially Cellular Phones! Its a portable scanner! I never seen a portable being able to scan Cellular phones yet besides the AOR 900 and the AOR 1000! It has also 100 Channels! In search mode you can Step from 5,12.5,15 and 30 Khz!
Its a nice Scanner. I like it alote but i think its discontinued! But you can try to Call Ace Communication and ask for a catalog of all the scanners there. It will give you an Idea! The Phone # is : 1-800-445-7717.
24 hours a day, 7 days a week!

..Hope you find the one U want!

...Dan (Bandit@nbnet.nb.ca)

4639. RS FREQUENCY COUNTER

Newsgroup: rec.radio.scanner

From: brian.oakley@chrysalis.org
Message-ID: <9406051111.0FPUR00@chrysalis.org>
Source record: 273504

you were using the counter properly. counters are not made to pick up transmissions over 25 feet or so at best. to get more range, an appropriate antenna and a preamp is likly to be needed. reception is also a function of transmitter power. sometimes you have to be very close to get any kind of reading. i did the same test you did. i couldnt get more than 5 or so feet from the cb and when i keyed my 2 meter transmitter i could see the leds light up all the way across the store. they are good bue lack lots of features others have. 73. wb5kxw

>: sorry bill but the actual law wording is very clear. the wording says the
>: type of communications that are illegal to intercept, not the frequencies. ecpa

There are at least 42 cellular control channels, nested on either side of 880 Mhz. They are use to dispatch voice channels. Does anyone have an opinion on whether it is illegal to listen to the control channel ONLY? This transmission is not encrypted, nor is it voice, nor is it switched through a telephone system. The signal and the data in it are generated at the cell site. Some information in it is indirectly related to control information passed back and forth on T1 lines though.

Also on the same vein, is paging monitoring illegal? I have heard rumors that the laws actually do not protect non-alphanumeric (since there is no privacy to be invaded or some other lawyer-think.) Anyone know?

Finally, I ran into a Californian who has a brother prepping to be a cop and therefore has been browsing the lawbooks/penal codes.... He swears that listening to cellular or cordless in Calif. is a felony (prisonable offense.) Any feedback?

Thanks,
Mick

>I've been told it's the 200XLT.

An old-technology, discontinued (the replacement is the 220XLT) workhorse.
Tends to suffer images in the 800 band due to single-conversion design.
Early specimens had problems with low-battery alarm and wipeout of
memories when an AC adaptor was connected.

If you can get one for WELL below $200 you might want to consider it.
Otherwise there are plenty of newer models, which scan much faster and are
more sensitive.

>fun going in around the 28-th and refusing to give your name and address
>just to drive the saleman wild. Some salemen would make up names and
>addresses just to keep their string going.

Hmmm...I find it interesting to discover this is "great fun"...guess it's one person's idea of fun. But, some 12 years ago I put myself through college working at RS and, admittedly, some of their products were junk, some were good...just like all stores. I seem to remember Lafayette was the same way, they had some good products and some equally bad products.

To my knowledge, since I have an insider's knowledge of sorts, the salesmen were required to ask for your name and address. There were no awards given...but a salesmen was judged by how effective he/she was in obtaining a customer's name and address...which was used to mail the monthly sales catlog to a customer's home. I guess it can be justified a bit more since several people talk about how great Lafayette was, yet RS remains in business...better marketing?

However, don't take this as a flame to anyone here...I admit I sometimes dread walking into a RS store since I know I'll probably know more about the equipment I'm intersted in than the salesman...but that can be said for most stores, can't it?

:
: No real solution I have the same problem with a paging tower located
: about 1 1/2 miles from my home. I used the Trident MPIF 1 filter from
: Ace Electronics (Mfg by Trident) it seems to help some all it really is
: is a bandpass(?) filter that knock out the 152 (?) Mhz paging range.
: I'm still looking for something better.
:
: Brian

take your antenna off & scan the 152.0 to 152.84 range. If your scanner stops on one frequency only after several run thrus then theres only one frequency to worry about. If you cant hear anything try a very short antenna.
If your willing to shell out the cash you can get a notch cavity from Wacom, Telewave or Celwave. Another company in Lomita, CA: Angle Linear makes bandpass cavities, not sure about notch. But a pass cavity can be used as a notch by using a T connector and shorting the other side.
If you do some nosing around with the site owner where the paging transmitter is located you can find the owner/licensee and bug them about not having a circulator or using a dirty transmitter. If all else fails then jam there 72mhz link (just kidding)

In article <2sp248$o6o@nyx10.cs.du.edu>, lthomas@nyx10.cs.du.edu (Layne Thomas) writes:
: I've heard many things both ways about Radio Shack and their
: products. I was wondering what was the basis behind this? Many people
: seem extremely pleased about Radio Shack's products/support/salespeople.
: Yet other people seem to absolutely hate Radio Shack. There doesn't seem
: to be much in the middle. I'm not saying this to support or bash Radio
: Shack, I'm just wondering why this is?

While I'm not a psychologist, one of the things they study is persistence phenomena, which is best stated in layman's terms as, "You never get a second chance to make a first impression."

RS got its start as a division of Tandy, a leather and crafts supplier, and I can stil remember one CT location where the stores were physically connected--which hardly inspired confidence in the electronics.

In its early days, RS products didn't measure up to those of other mass merchandisers. The RS products were shoddy. My favorite example is how even the splicing tape would bleed, ruining the tape you were trying to salvage. In NYC, for example, knowledgeable consumers would avoid RS in favor of Lafayette Radio and Electronics. RS's position could be summarized in the words of a TV repairman when I commented on his using Archer color tuner cleaner: "It's the one good product they sell." And that gets to the heart of the matter. Most of the products with the RS label are made by other suppliers and the quality of the product depends on the supplier. Many RS scanners are made by Uniden and get average reviews. The PRO-43 and 2006 are made by GRE of Japan and get splendid reviews. As for their computers, well the TRS-80 wasn't called the Trash-80 for nothing, but many journalism careers were made on a RS laptop.

In summary, I'd say the short answer to your question is that your impression of RS depends on when you first started doing business with them. I've been going there long enough that I know that some of their products are first rate but I *still* shudder as I walk through the door, wishing Lafayette were still around.

Oh, and not to forget . . . RS salespeople have this annoying (to many) habit of asking you for your name and address for their computers. They've become slightly lower key about it, but at one time, I was told, RS handed out awards if salesmen had a perfect month, that is, they collected the name and address of every customer. It then became great fun going in around the 28-th and refusing to give your name and address just to drive the saleman wild. Some salemen would make up names and addresses just to keep their string going.

Nothing taken as a flame. The reason it was such "great fun" is that it
gave the consumer some way to pay back salesmen who were particularly
obnoxious about asking repeatedly for one's name and addres after being
told you didn't care to divluge the information for a $2 cash purchase.
Remember, it was the salesman that initiated the game, not the consumer.

'Tis true. Lafayette is no more and RS is thriving. The reason
Lafayette went under in the early 80's is that they expanded too quickly
and the cash didn't flow quickly enough.

It's wrong to say that RS and Lafayette products were comparable. Their
cables were typical of the kind of care each put in to getting products
from their suppliers. Lafayette's were clean. RS's connectors looked
like their vendors never cleaned their molds. RS's products almost
always carried their own name; Lafayette sold many products under the

manufacturers labels. Lafayette products, when sold under the Lafayette name, were often made by a higher quality vendor than that of the comparable RS product. But, as you say, it's RS that's supplying much of American with home electonics today, and their quality is much improved over that of the 60's and 70's. (I'm even a *Preferred Customer*--good for 10% off one item each month.)

I need an antenna for my 2006 and have little knowledge of what to look for. I will probably have to place the antenna in my attic because of space problems. What is the best way to go about increasing the range of my scanner,is height of the antenna the key or is antenna design the way to go. If I cannot figure out a decent way to run the outdoor antenna cable I will have to go with a indoor system or some kind of antenna that attaches directly to the back of the scanner. Any recommendations on that approach,I have been looking at Groves indoor system that uses a pre-amp. Has anyone ever used this system and how well does the pre-amp help?

Thanks for any help
Mike

It could also be a wireless headphone or speaker setup. Apparently,
some of them also use the 902-928(?) mhz range.

4653. uniden Bear Tracker...?

Newsgroup: rec.radio.scanner
Date: 1994-06-05 22:52:17 UTC
From: rr03@academia.swt.edu
Message-ID: <1994Jun5.165217.1@academia.swt.edu>
Source record: 273506

I hope this question wasn't asked several months ago...

I received an "early summer '94" DAK catalog that advertised a receiver billed as the "radar detector extinctinator" The picture of the unit had a label that read "uniden BearTracker". It's apparently a scanner preprogrammed with "thousands of police and highway patarol frequencies for all 50 states..." Apparently when you drive across a state line you simply press a button on the unit to select the state you're in... and listen.

There's no mention of what frequency ranges the unit receives. Nor is there any mention of how to deal with changes in frequencies when they occur.

My question: Does the receiver work?... Anyone have any experience with it?

That's exactly what it was. Except it was an image of the real freq.
928.9375mhz. I just walked around the neighborhood till it got real strong.
Then knocked on a few doors. It was a wireless speaker system pluged into
a DMX box from the cable company (I wondered why there were no adds)

Thanks for all the responses.

From: shc@mt747.mt.att.com
Message-ID: <CqyF5y.Mxn@nntpa.cb.att.com>
Source record: 273513
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Let me try this once more...

Can anyone post a list of those states in the US that banned mobile scanners ? All I know is NY and would appreciate if someone can list them all out.

If I travel from NJ (legal), with scanner turned on, and cross the state line to NY (illegal), I should turn it off ? Will the NYS trooper stop me if he/she sees the scanner antenna ? What if I carry a portable in the car and programmed various NYS freq in it but claim that I turn it off when I cross the state line ? Can they confiscate my scanner ?

Any comments/suggestion/answers are appreciated. Thanks in advance...

I don't think you were decoding "frequency inversion". I think you might
have run across an ACSB system. ACSB stands for Amplitude Compandored Side
Band and the transmitted signal has a 1kHz pilot tone for receiver synch.

Source record: 273509

Why does GRE require you to clip a diode to increase the speed? It seems to
me that faster is better, and a scanner manufacturer would want to make
their scanner as fast as possible right out of the box. Does the mod negatively
affect some other aspect of the scanner? If so, why didn't they just install
a switch so that you could easily turn faster scanning on or off when you like?

> Dave
> --
> Dave Bushong, Wang Laboratories, Inc.

I've read many different definitions of malice in court cases, so I don't accept the idea that there is a single "legal meaning" of malice. My legal dictionary has many, including:

The state of mind that accompanies the intentional doing of a wrongful act without justification or excuse. 99 A2d 849, 854.

"[I]ntent to cause the very harm that results or some harm of the same general nature, or an act done in wanton or wilful disregard of the plain and strong likelihood that some such harm will result. It requires also on the negative side the absence of any circumstance of justification, excuse or recognized mitigation." 118 N.W. 2d 422, 425.

"[A] reckless disregard of human life which proceeds from a heart and mind devoid of a just sense of social duty and fatally bent on mischief." 234 A.2d 442, 443.

"Maliciously" can mean a lot of different things, and IMHO, the word is evidence of a poorly written statute since its meaning is so vague. It can vary from jurisdiction to jurisdiction, depending on what the courts have decided it means there, or the legislature, in the rare chance that it has provided a definition to go along with the statute. I don't know what the word means in California with respect to the cordless phone statute. You'd have to see if any cases have gone to court, and see what has been decided. Maybe I'll look into it some time when my free access to Lexis and Westlaw is restored in the fall.

Be safe, when you cross the NY state line, not only turn off the radio,
but lock it in the trunk of the car. It will certainly help to prove
your claim that it was off since entering the state..

From: usandman@mcl.ucsb.edu
Message-ID: <2sulll$khb@ucsbuxb.ucsb.edu>
Source record: 273514

I've got the pro-39 and am interested in any mods for is. So far the only one found is to remove the D6 diode for expanded 800 coverage. I was reading a mod for the pro-43 at oak.oakland.edu which expanded the 800 coverage as well as opening up the 52-88 Mhz coverage by moving a diode rather than removing it. My question is whether there is a location that I can move the D6 diode so I can at the same time open up the lower bands. Any and all help appreciated.

One thing that really bugs me about this is that I would go into RS several times a week to buy misc. parts. Each time I would give my name, address, etc, but every time the RS ad came in the mail, it said Brent Miller. In 3 YEARS they never corrected my name!! My 10% discount card also came with the wrong name on it. I have a hard time waiting the extra few minutes for them to one-finger type my info into the system when I know they will never update my information.

4665. re: are all cellular phone calls illegal to monitor

Newsgroup: rec.radio.scanner
Date: 1994-06-06 11:55:05 UTC
From: davidm@iglou.iglou.com
Message-ID: <1994Jun6.115505.15933@iglou.com>
Source record: 273516

This is in regards to the fellow asking whether or not it was legal to monitor the data only channels of a cellular phone system. I'm sorry I didn't write down your name...

The way I read the ECPA (and if I didn't mention before, no, I'm not an attorney) it looks to me as if it would still be illegal, since the frequencies involved are allocated to a common carrier, and are therefore not considered to be intended for reception by the general public, regardless of what they are carrying.

At this point I'd like to ask a question. Why on earth would you want to listen to the data channels?

It is also my opinion from reading the ECPA that monitoring of any pagers (except for tone-only systems) is illegal, regardless of whether they carry voice or digital data.

And lastly, I don't remember whether it is a felony or not, but in California it is indeed supposed to be illegal, by state law, to listen to cellular or cordless phones. But I'll admit I'm not absolutely positive. Since I live in Kentucky, I don't keep up with California laws as much as I try to stay up with Kentucky and federal regulations.

They have made the DJ-X1 pocket scanner for a few years now. It's very
similar to the ICOM R-1 in size and, unfortunately, in performance too.

-> outlaw any scanners that cover cell channels, or police/fire/public
-> service bands.

Hate to break this to you, but Cellular reception capability was
outlawed on scanners as of 26 April 1994. There may still be some
models of old Radio Shack 2006's which can be "diode-clipped" to
restore cellular but these are superceded by the 2006A models
which have the CPU code written to deny portion sof the 800 Mhz
band and even full range commincations recievers (like the ICOM
R-7000 and R-7100 - favorites of GOVT snoops) are now coming with
portions of 800 Mhz deleted in the CPU.

Are you wearing an Electronic Tracking Bracelet ?

No ? You don't have a court ordered one ? No Need ! Your cell phone
on power-up sends a digital "sign-on" to the nearest Cell Tower and
the systems polls your phone every 5 minutes to see if you are still
on the system and which cell you are nearest. As long as you have
your cellphone on you can be tracked (and are by the system - it has
to know where to send your incoming calls.)

The ESN and home number data is easily tracked by programs like the
CELLSCOPE (tm) program used by the FBI and other Law Enforcement
agencies all over North America. It can track the data channels and
trip a tape recorder anytime your Cellphone sends/recieves a call
and this is all done from a database on a PC (portable if you like)
which holds entered ESN/Call number pair and monitors the datastream
in realtime to intercept any target. Needs no "wiretap" warrant .

So now, again: Are you being tracked electronically ?

I've had my Pro 46 for about a month now and like it, but there has always been a lot of hissing on many bands. I thought that was just the way it was, but by shear coincedence I needed an electrical outlet to plug in my vacuum the other day, and I choose to unplug my security lamp with the 24-hour timer. The scanner happened to be on, and as soon as I unplugged the timer the signal cleared right up! I was shocked, so I put the timer back in and there was the hiss again. It seems that this timer thing is broadcasting noise or something, and it reaches everywhere in my house! Needless to say I don't use that timer anymore. Just thought others should know... -- Paul --

(including cellular), 100 channels, scans at 100 channels per second,
has unique alpha-numeric display which can be programmed with a personal
computer (software included). Like new, in original box with heavy-duty
mobile speaker, programming software, all manuals, shipped UPS ground
for $235.00.

Here are some specs:

The bands:

29 - 54 MHz 5KHz spacing

118 - 136 MHz 5KHz Aircraft band (AM)

136 - 174 MHz 5KHz

406 - 512 MHz 12.5 KHz

806 - 956 MHz 12.5 KHz

All that is blocked out is the TV video bands. You can tune in TV audio with
this scanner but it isn't too good for that because the Uniden only has
narrow FM capabilities.

It has ten banks of ten channels for a total of 100 channels. scan rates
are two speeds selectable - 30 and 100 CPS!

The size is 5 1/2" X 6 7/8" X 1 3/4". Weight is 2 Lbs.
Speaker (included) is external.
Antenna is external.

The software (included) comes with its own manual. It can be used on any
IBM compatable computer from a PC to the fastest Pentium machine around.
The Cellular lock-out is bypassed with software but Uniden gives the secret
instructions only to Government agencies and Law Enforcement agencies. This
"secret" information is included. All you need to use the software is a PC
with a serial port and a cable with a standard DB-9 female connector.

Remember, this scanner is a special-function unit - designed by the California
Highway Patrol for use in the cruisers. They're really neat especially with
the alpha-numeric display and capability of being programmed by a computer.
I have one myself and wouldn't sell it. They're a great mobile scanner!

Unless you have an amateur radio license, I'd do as Bob Sherman
suggests, remove it and put it in the trunk, or in some location
that couldn't be easily reached if you were stopped (i.e. a
place that the cop couldn't easily claim you quickly disconnected
and tossed it into).

> Will the NYS trooper stop
>: me if he/she sees the scanner antenna?

With all the cellular, ham, CB and all other antennas that are now
on so many vehicles, odds are you'd not be pulled over just because of
the antenna. Additionally, what cop even has the ability to tell
a scanner antenna from any other antenna?

> What if I carry a portable in
>: the car and programmed various NYS freq in it but claim that I turn it
>: off when I cross the state line ? Can they confiscate my scanner ?

I don't think they'd confiscate, but why chance it.

>Be safe, when you cross the NY state line, not only turn off the radio,
>but lock it in the trunk of the car. It will certainly help to prove
>your claim that it was off since entering the state..

If it is locked in the trunk, you are not violating any law. Good
advice!

Friends,

A recent Wal-Mart flyer advertises the following:

"Uniden(R) Handheld Scanner - Includes 12 bands with aircraft and 800 mhz. Stores up to 100 channels. Turbo Scan(TM) allows you to scan 100 channels per second. One-touch weather channel scan capability. No. SC150B. $199.73"

The photo shows its rounded bar-of-soap shape, LCD display, duckie antenna and oddly-shaped (like some TV remote controls) buttons. The unit is labeled "Twin Turbo SPORTCAT" and "Uniden Bearcat." Not unlike the RS Pro-46. Does anybody know what the bloodlines are of this beast?

By clipping this diode you eliminate a range (or ranges) of frequencies. (So "I" have
been told.) I have'nt done this to mine.

There has been some discussion of whether the faster speed led to missing
transmissions. I don't believe it was resolved one way or the other. Also,
someone claimed that all clipping D2 did was to eliminate the slow scan speed
(the 2006 comes with a slow and fast scan rate). Don't know if this has been
verified or challenged.

>My question: Does the receiver work?... Anyone have any experience with it?

These devices usually rely on the mobile repeater frequency that has a limited transmit range. The main problem is that if there is no radio traffic, you won't hear anything even if you are right next to a patrol car. Also, certain states like California, now disable the repeaters while the car is moving. I wouldn't rely on one of these. I used to plug 154.905 into my scanner when I lived in CA. This is essentially the same thing the BearTracker would do. You'll have to ask around to see what your state's frequency is (if they have one).

> another matter.

The law is clear. It is illegal to listen to cellphone conversations. It doesn't matter if your radio is malfunctioning and picking up cellphone conversations when it isn't supposed to. It doesn't matter if you use an old TV set with a UHF tuner than can tune the cellphone band even though it's only 'supposed' to pick up TV stations. It's still illegal to listen. I'm sure if you get a copy of the actual law and read it you will find that this is the case.

++> and weak signal reception. I wonder...what about a brute
++> force sharp filter for the paging freq?
++>
++> Any ideas will be appreciated.

Here's what I've run into and what I've been able to do so far.
My scanner is a PRO-2028, and one frequency of interest for me
is 130.525. Well, on this scanner IF=10.85 MHz, and as it
happens to turn out, 130.525 + 21.7 = 152.225 MHz, which just
so conveniently has LOTS of digital pager type activity. As a
result, it renders listening to 130.525 as almost completely
useless. I would love to find a lowpass or bandpass filter with
a steep enough cutoff to do the job. So in the meantime, I've
let the scanner do the filtering for me - I set the scanner to
listen to 130.525 - 21.7 = 108.825 MHz, and let the freq of interest
be the image which is now picked up - if the signal is strong
enough. I do end up missing about half of what is available doing
this, but that is much better than missing 90%. The only thing
I could think of to help this situation is using an amplifier on
the incoming antenna signal. Would this help out and is this
possible ??? - any suggestions ???

Source record: 273437

Date: 4 Apr 89 14:24:01 GMT
Subject: PRO-34 Scanner Modifications

In the May 1989 edition of Popular Communications is a
"Letter to the Editor" on the Radio Shack PRO-34 Scanner. Below
is the text of that letter.

PRO-34 Scanner Modification

In regard to the information presented (March Issue) on the
handheld Radio Shack PRO-34 scanner, my own observations on the
modifications have been:

1. To restore missing 800 MHz frequencies, remove D-11.

2. To add 66 to 88 MHz (European Coverage), install a diode at
D-9.

3. D-10 must remain in place for full 800 MHz coverage.

4. If a diode is added at D-13 it cuts out aero band, also seems
to affect 800 MHz channel spacing.

5. D-12 added dosen't seem to have any affect.

6. Only D-10 and D-11 are factory installed.

I wish to thank you for a fine and informative magazine. I
have had much reading enjoyment.

> Maybe this is why Al Jr. lost his radio durring the race!
>
> Albert

yup.. I was listening to them at Indy adn it sounded like Speech Inversion. but I can't believe Penske would use such a poor system.. it sounded like they were transmitting ok even once their communications quit.. so I'd bet on bad com making the scrambled communications unusable.. maybe they will learn from the NASCAR teams that tried to scramble before..

Or maybe they will just do what some teams have and use Cell Phones and jusr redial during Yellow flag laps to get a new channel. (using frequency hopping to hide)

BTW: all my frequencies were correct for Indy so if anyone needs a copy for reference for the rest of the INDYCAR season drop me a note.. some may change but many should remain the same for the season.

> > ----------

This is the rote answer I used to reply with, too, but I learned something yesterday that changes my opinion slightly. I received my reminder card for crewing at the Balloon Classic this year, and it asks: do you have an open pickup truck and how big is it, and do you have a CB radio.

So, a better answer (said in part by others before me) is: they'll use the aviation band when they have to talk to controlling agencies, but it's less likely that that's what they coordinate chase teams over, and that's what will probably have more interesting content. CB is one choice, and since not everyone is a ham, it's a really popular choice. They get volunteers to crew and chase a lot, so they need a system that a lot of people are likely to have already.

Typical NY law. NewYorkers and Californian's need to be re-located elsewhere like for instance Mars or better yet Jupiter in a few weeks.

From everything I can tell it seems to be a BC 200xlt minus 100 channels,
plus it has turbo scan.

At least they don't sell the mailing list. I give a different middle
initial to any business that might sell a mailing list. That way I
know who sells my address. Radio Shack's "initial" has never come to
my house on anything but a RS mailing.

The worst offenders seem to be mail-order women's clothing outfits.
Once my wife ordered a blouse from an outfit called "Willow Ridge".
By the time that "initial" was sold and re-sold, we were getting
mail from 13 different outfits, including a christian book company.
(I wonder if they figured that only christian women order blouses?)

Ok, I'm far enough off the thread. I'll get off now...

For those of you Barbara Striesand fans, she will be in town the next
few days, staying at the Fairmont Hotel.

According to local news media her security is Extremely tight
(something about being on a Palestine hit list). Her security
people are supposed to be ex-Israeli Intelligence personnel
(again this is all from the local news media).

Since I like monitoring other people's business, anyone have
a list for the San Jose Sharks Arena ?

Also I will be looking on all the usual itinerant (and not so usual)
freqs to see if these guys are pro's or amateur.

Please post replys for all to benefit, and thanks.

Sometimes... a simple 10 to 20 dB attenuator in series with the antenna input will do the trick on pager intermod. Yes, this decreases the sensitivity of the scanner, but most scanners are too sensitive to begin with for local stations.

You can find these in Radio Shack (as TV attenuators), but you must buy F-to-BNC adapters, at hamfests, or you can make your own. Look in the ARRL Handbook for the design details.

Nope, we've got the entire RNI crew comming down and they will do the show
to the total shock of George at WWCR. Either that or we will have Pygmies
chanting the commercials in acient Greek. Would you believe we will do our
impressions of the Marx Brothers doing the show? Anyway, Kristin Kay is
in Sing Sing Prison, or at least lives near there.

: When did the expansion begin? I remember getting large Lafayette
: catalogs in the early 60s, and I thought they carried other mfrs
: ham gear, for example. In about 1969, I bought a Norelco cassette
: player at a Lafayette store in the Buffalo area.

Perhaps I should retract my retraction! In the late 70's Lafayette
started following RS's lead of opening mall stores. They became a
cross between what they were and a stero outlet. They'd routinely
take out adds featuring their $200 stereo system, $300 system, etc.
You'd walk into a store and there would be stacks of turntable,
amplifier, and speaker boxes. Take one from this stack, one from that
stack, and so on. Reasonable stuff, too. BIC turntables, Signet cartridges.

4710. Roch, NY club 1/2

Newsgroup: rec.radio.scanner
Date: 1994-06-07 01:15:00 UTC
From: David.Stark@p2.f333.n2613.z1.fidonet.org
Message-ID: <771010693.AA05393@rochgte.fidonet.org>
Source record: 273385

The first meeting of the Rochester area's newest radio club was held on Saturday, June 4 at 13:00. The six members in attendance made a few preliminary decisions and discussed some options for the future operation of the club.

If you would like to join us, please contact David Stark, 580 Seneca Pkwy, Rochester, NY, 14613-1020. You may call me during evening hours at (716) 254-1726 or send Internet Email to me as david.stark@rochgte.fidonet.org. If you are on Fidonet, my Netmail address is 1:2613/333.2 (routed via my Bossnode).

Some of you who are reading this message have already expressed interest in joining the scanner club. I need information from you. Please complete the survey information at the end of this message and email it back (or phone it in if you wish).

Present at the first meeting:

David Stark, Dave Chen, Peter Traeg, Dick Deyoung, Tom English, Charles Wells.

Decided at the first meeting:

Dues: No dues are needed as long as the club does not conduct any activities or provide any services that cost money.

Meetings: Future meetings will be held at the same location (my house). This is a fairly central location and has the advantage of being free of cost. I have plenty of room for us to meet and am willing to continue acting as host.

Officers: Those attending the meeting agreed that we don't need officers until/unless we start collecting dues for some reason, or until the group becomes too large to run informally. We prefer to focus on our common monitoring hobby rather than the administrivia and politics of club offices.

Notification: We would like to set up a private, informal notification service to make interested members aware of notable incidents as they are occurring. Since using paging services a la Firenet is expensive, we decided to do whatever we can for free until there might be enough interest to start a more formal network and charge for the service. Member notifications would usually be by telephone, and we need to design a telephone tree that minimizes (or eliminates) the need for long distance calling.

To be decided at or before the next meeting:

When will the next meeting be? I would like those interested to send me a list of the best dates and times during July and August for a one- to two-hour meeting.

Should we have a net on amateur radio for those members who are licensed hams?

What types of incidents do we want to trigger the notification calls? Should it depend on the time of day, location, member's individual interest, or any combination of these or other factors? Also, who is going to be monitoring, what and when?

Should we have a newsletter? If yes, then who will edit it and how will it be distributed? (Mailing costs money, but if we meet regularly it could be made available at meetings.)

What will be the agendas of future meetings?

What will we call ourselves? I forgot to bring this up at the meeting, so here is my proposal - Finger Lakes Alert Group (FLAG). Whattya think?

This has gotten sort of lengthy, so I will send the survey/application questions in a separate message.

73 de Dave, NF2G

MA>Someone posted a while back a distributor (in Texas
MA>, I think) which sold scanners along with RS scanners.
MA>I wanted their address or if someone can tell me if
MA>they are less expensive than RS, guarantee, etc.

I do believe that you are referring to a company called Marymac
Distributing that's located in Katy,TX. I called them the other day and
they answered the phone by saying "Hello, Radio Shack...may I help you?"
Talk about instant turn-offs! I called asking for a catalog and was told
that they are a mail-order business and do not send out catalogs.
Doesn't make much sense to me. The number I was given for Marymack
Distributing is (713) 392-0747
If I were you I would also try Scanner World located in Albany NY.
Their number is (518)436-9606. Don't be put off if the nasty old wench
with the nasty disposition answers the phone. I've been told they have
the best prices around!

Product: Realistic PRO-34
Purpose: Restore continuous 800 Mhz coverage

** Disclaimer...Doing this procedure is done at your own risk. This
procedure is fairly complicated and should not be attempted by anyone
unfamiliar with soldering small circuit boards. **

** Warning...Performing this modification restores certain portions of
the 800 Mhz band that is prohibited by U.S. federal law to monitor. **

The following procedure is from the December, 1988 issue of Monitoring
Times, page 89.

1. Remove the battery cover and battery, four black screws from the rear
cover, and volume and squelch knobs.

2. Remove the rear cover, lifting back and upwards to clear the control
shafts (do not remove belt clip or circuit board screws.)

3. Unplug the brown volume control connector (green, yellow, black
cable) and white squelch cable connector (white, black, red cable) from the
linear circuit board.

4. Unsolder the ground lead from T111 (at the corner of the linear
circuit board above the external power connectors). (My note- my
particular unit didn't have this connection. This may be true of other
units.) Unsolder the two power switch leads from the back of the volume
control. Unsolder the antenna connector center pin and ground leads from
the linear circuit board.

5. Unscre the four combination screws that hold the linear circuit board
and held the rear cover screws. Grasp the linear circuit board at the top
and lift it straight away from the front case, unplugging the 16 pin
connector.

6. Remove the three screws holding the metal frame assembly which held
the linear circuit board to the front panel. Unplug the red-black power

lead and lay the frame aside (it is still connected to the battery contacts).

7. Locate diodes D9-D12 on the volume control side of the logic circuit board under T1; D10 and D11 are marked. Clip one lead of D11, separating the gap slightly (it may be resoldered later if desired).

8. Re-assemble the board by reversing the disassembly procedure.

For information...D9 enables 66-88 Mhz, though re-alignment is required and 30-54 Mhz band is lost. D10 enables 896.1125-960 Mhz and is already installed. D12 disables 136-146 Mhz. I found on my unit, which was older, D12 changed the stepping of 12.5 Khz on certain portions of the band where 30 khz would be the default.

jo> faster scanning on or off when you like?

Hi, Ken...
There are no negative side effects to the scanner when you clip the
diode. It is possible that some channels were skipped because of the fast
scan rate, though no difficulty with this has been reported.

Why ask Why? <g>

I would assume the reason the diode is in the 2006 to limit the speed in the first place is for reliability. Maybe the 10% decrease helps the C.P.U. last a little longer and thus cut or virtually eliminate warranty problems. Les

To obtain mods for a variety of scanners you can (if your on the Internet) ftp to oak.oakland.edu. I'm not sure of the directory path but a little poking will get you results.

From a (mostly) silent reader...

Allied is not dead. I saw an add a couple of months back in (EDN or Electronic Design, I'm not sure which) for Allied that said they were"back".

When I called to order their latest catalog, I was told they never went out of business. They went through a couple of hands after Tandy, and are now part of the Avnet Company.

Anyway, their new catalog has much of the same feel as the last time I saw one (when I built a Star-Roamer Knight-Kit many moons ago). If you are interested call 1-800-433-5700. You should be able to get a catalog. (The 1994 just came out; at about 1000 pages :-)

This is probaly true. Another reason is for future models. They can do a cosmetic make-over of the 2006, remove the diode and sell it as "super-hyper scan" since it has a faster scan rate than the 2006. They did a similar trick going from the 2005 to the 2006.

Another problem using a converter is that it will not search selected portions of the 800 band using the correct 30 KHz spacing.

All of the above advise is probably quite true - BUT - Living in NY
state - I have had several different scanners mounted in my vehicles
for many years and have never had anyone even question it. This
includes having gone thru several state police and local sheriff
"traffic stops". I think the real message is don't flaunt it and
don't be an ambulance chaser and you will be all right.
Of course there is always the "better safe than sorry" logic which
also has a lot going for it.
Anyway, have a safe trip!

I recently saw the Thunderbirds at Wilkes Barre-Scranton (PA) air show.
Here is what I VERIFIED -
141.850 - By far the busiest freq - used before and during the show.
Before the show they ran thru the whole routine on this freq
and during the show this was the MAIN delta formation freq.
322.950 - Used on the ground before the show for pre-flight check out.
During the show was used by the two solo planes.
235.250 - Was ID as TB control but was used very infrequently.
413.100 - Very active before the show. Mainly maint and "get ready"
type chatter, ground crew, maint etc. Was used as the
T-birds were taxing out to inform them that their "chatter"
was being re-broadcast thru airshow PA system.
120.450 - Before show seemed to be keyed along with 141.850 but during
the show there was no further activity on this freq.
122.850 - Used by "Swift Magic" and couple other acts during the show.
I have seen both the Angles and the T-birds and I can tell you the
T-birds have MUCH more chatter to listen too, although both teams are
GREAT.
Enjoy the show, hope this helps a little.

It is possible to squeeze out intelligible voice from NBFM cordless phones
using simple frequency inversion exactly as the poster described. You tune
around the center frequency in SSB mode. Works on the Yupi. Works on my
IC-R7000. Probably works on all the handhelds that tune SSB.

I own one...and I love it... I would buy this one for sale if I had some
spare change.... maybe in a few months I'll get another one.

Complaints: Rejection is not the greatest... my local cops are on 154.725
and the state police are on 154.680 ... I get some bleed over sometimes...
but this is due more to receiver saturation ... I can see the cop's tower
from my house.

Also, I cannot enter 12.5khz splinters in the highband portion of the radio.
I can enter pretty close...close enough to hear a good signal, but I am not
right on the money....

Lastly, no PL decode capability... that would have really made it great!

All in all...it is a GREAT unit... alphanumeric display is wonderful...not
so good in direct sunlight, but wonderful at night!

John

: Oh, and not to forget . . . RS salespeople have this annoying (to many)
: habit of asking you for your name and address for their computers.
: They've become slightly lower key about it, but at one time, I was told,
: RS handed out awards if salesmen had a perfect month, that is, they
: collected the name and address of every customer. It then became great
: fun going in around the 28-th and refusing to give your name and address
: just to drive the saleman wild. Some salemen would make up names and
: addresses just to keep their string going.

Radio Shack employees are REQUIRED to maintain a percentage of 80% or
higher names and addresses on tickets. Failure to maintain that number
could result in termination.

Radio Shack does not sell their mailing list, and they only send out
flyers to persons who shop there frequently. And, Radio Shack is not
the only company doing this. Sears has now started a similar policy.

Personally, I take offense to your practise of intentionally going in there
to mess up the salesperson. They are only doing their job, and many
Radio Shack salespeople would much rather NOT deal with the Names and Address
thing. You are a special kind of scumbag: you probably find it funny,
but I wonder if anyone got fired because of your tactic. You, sir, need to
perhaps work for Radio Shack for a day, and see how much you appreciate
it.

You can also use this SSB trick to drag intelligible speech out of a digital voice transmission if the rep rate on the PN code is not low enough. I sorta "introduced myself" at Rockwell when I moved there that way. Item was a little "enciphered" handheld with digital voice. THe code's rep rate was something like 1KHz or so. Folks were feeding it a "word tape" to check intelligibility. They also had a "surveilance" receiver for catching the raw signal. They nodded sagely that it was indeed unintelligible.

Well, in the lab I had a HIGH signal level. I slid from my bench over to that one when Stan was taking a break. I backed up the recorder and played it back. I tuned the receiver to one of the nulls, turned on the BFO, and with a little judicious tweaking was reciting the words on the tape in clear. Stan came back. I heard me reciting and recognized the words and sequence. He looked at me. He looked at the radio. He looked at me. He looked at the recorder. He strode over to the recorder and randomly repositioned the tape and restarted it. I thereupon resumed my recitation. He put on the earphones from the recorder and verified my recitation. He looked at me. He looked at the radio. "HOW DOD YOU DO THAT!" I explained. He added another four bits to the PN generator. That spoiled my effect enough he could release it to the rather fussy customer. He says he was glad *I* discovered it rather than one of the customer's folks.

: it.

I'm tempted to reply that you should have better things to do than worry about what went on back in the 1960's when RS started the policy, many people found it offensive, and were only too delighted to have a way to return the discomfort. If you followed the thread, you would have realized that I was describing the different ways in which people have viewed RS ove the years. You may not like it, but many people really did go into RS at the end of the month just to get back at the salesmen by not giving their names and addresses. I didn't get to be a preferred customer by jerking RS employees around, but, if it makes you feel better, think what you will and flame away. :-)

(I'm glad I thought twice when writing the original post and didn't add the hearsay about . . . whoops, almost wrote the story about how, in the early days, some of the product was held in such low regard that some employees described it as not worth stealing. Lord only knows what false conclusions some readers might have drawn.) :-)

You, sir, have the keyboard equivalent of a foul mouth and I cannot put a smiley after this comment.

BFD. If enough people told them to "shove it", then they would no longer
have this meaningless performance measure.

: Radio Shack does not sell their mailing list, and they only send out
: flyers to persons who shop there frequently. And, Radio Shack is not
: the only company doing this. Sears has now started a similar policy.

But they are not as obnoxious about it - at least, not at the Sears where
I shop.

: Personally, I take offense to your practise of intentionally going in there
: to mess up the salesperson. They are only doing their job, and many
: Radio Shack salespeople would much rather NOT deal with the Names and Address
: thing. You are a special kind of scumbag: you probably find it funny,
: but I wonder if anyone got fired because of your tactic. You, sir, need to
: perhaps work for Radio Shack for a day, and see how much you appreciate
: it.

Personally, I take offense with Rat Shack prying into my private life. I
would do so, even if they did not send eleventy million sales brocures to
you.

If I worked for them, I would make it known up front that I would NOT
collect names and phone numbers. If they insisted that I do so, then
they could find some other flunky. Many people value their diminishing
privacy, including the privacy of their mailbox - I am one of those
people.

I do not intentionally try to mess them up - I simply say "No." They can
enter any name or address they wish - or leave it blank. It is immaterial
to me.

:
: Hate to break this to you, but Cellular reception capability was
: outlawed on scanners as of 26 April 1994. There may still be some
: models of old Radio Shack 2006's which can be "diode-clipped" to
: restore cellular but these are superceded by the 2006A models
: which have the CPU code written to deny portion sof the 800 Mhz
: band and even full range commincations recievers (like the ICOM
: R-7000 and R-7100 - favorites of GOVT snoops) are now coming with
: portions of 800 Mhz deleted in the CPU.

Close, but not quite correct. It is now illegal to import/manufacture
for sale, scanners that receive (or are "easily" modified to receive)
the cellular frequencies.

It is not illegal to import a few, for your own personal use.

Also, I believe the only difference between the original 2006 and the
2006A is the panel light switch. I understand that any successor will
have a different number.

Well, I had one and I liked the receiver performance from a purely subjective point of view. The case, the display and overall construction was excellent. The audio power was remarkable. On the downside, however, it's not really a scanner, it's a scanning receiver. What's the difference you ask?

It is not capable of scanning ranges of frequencies. It can only scan from amongst a set of 100 pre-programmed memory channels. It has no VFO whatsoever. Therefore, it's useless for scan-searching the bands, and is only really good for monitoring a set of predetermined frequencies. Programming it is very slow - takes about 3 minutes to dump the 100 memory channels to/from your PC to the radio, and the data stream, although RS-232, is only 1200 baud, and it's encrypted. The alphanumeric display is great, but the alpha characters are only accessable through remote programming. You can, however, manually enter frequencies from the keyboard as long as the channel you want to use has not been marked as read-only through the the external programming interface.

And that's why I sold mine. I've got an RS-2006 now which does everything I need from a scanner.

4749. Pro-2006/2005 Design Weakness?

Newsgroup: rec.radio.scanner
Date: 1994-06-08 01:17:15 UTC
From: awarburt@helios.physics.utoronto.ca
Message-ID: <Cr20ws.45B@helios.physics.utoronto.ca>
Source record: 273400

Hello All:

I have a Pro-2005 that has lately been behaving rather oddly. When the radio hasn't been turned on for about 30 minutes or so, it seems to work fine for a few minutes, but then the weird stuff starts to happen.

In the FM narrow mode, the audio starts to huff and puff at a rate of approximately 3 Hz, i.e. it sounds a bit like a picket-fence effect, as though something had become unstable and began to oscillate. When I'm listening to a frequency with a carrier and modulation, no amount of fiddling with the squelch can bring any results (it's either noise at low squelch, huff and puff at high squelch).

In AM mode, when scanning, and a channel with a carrier is stopped at, one hears the first fraction of a second of audio, only to have it fade away into oblivion. Turning the squelch right down only gives a very quiet hint of muffled noise. Truly strange.

Now here's the kicker: a few months ago I started using a 12 Volt adaptor instead of the built-in transformer to keep the unit cooler and get rid of the hum. I just checked the output of my adaptor, and discovered that it's delivering a whopping 18.1 Volts! Hmm...

I hope I have given enough hints for some kind and informed soul to help me out. I would really like to fix the problem.

Cheers, andreas

I've noticed that recently in the late evening, around 11
pm, that commercial FM station 94.1 has been coming in at 30.xxx MHz
on my scanner! This only happens during the late evening, and the
reception varies from being crystal clear to very garbeled. I've
got a Radio Shack Pro 2030 hooked up to a TV antenna, and it's also
sitting right above my stereo. Also, there are two televisions
hooked up to the same antenna as the scanner. I don't get any other
commercial stations in besides that one on the scanner, so I'm
really perplexed as to what is going on. Does anyone have any
ideas?

4753. I turned my PRO-2005 into a 2006

Newsgroup: rec.radio.scanner
Date: 1994-06-08 03:05:13 UTC
From: mike_diaz@smtp.esl.com
Message-ID: <mike_diaz-070694185730@m11105.esl.com>
Source record: 273404

I turned my PRO-2005 into a 2006.

Hi everyone. I thought some of you would find this informative.
This CPU upgrade is not for the faint of heart.
You need good eyesight, and a good magnifying lens too.

Since I finally got another scanner (a 2006A). I decided it was time
to *fix up* my old 2005. I put the AGC version (I hated the germanium
diode detector version) of the LED S-meter (from Bill Cheeks Scanner
Mod book #2) into it, and *I love the feature*. I m going to put one into
my 2006A when I m done upgrading the 2005.
I then ordered the CPU for the 2006/2006A (P/N GRE-0918) from R.S. ($36)
I de-soldered the old CPU and the 7.36MHz resonator, soldered in the new
CPU and a 16MHz crystal (the 2006 runs at 12MHz). This combination
doubled my scan rate from 20 channels/sec to 40, it really screams now,
figuratively speaking.
To do this mod you MUST be familiar with soldering surface mount
devices.
I used the soldering station my assembly person uses, (a perk of being an
engineer). It has a controlled temp iron, a dental pick, a lamp with a
built-in
magnifier lens, and a 7-30x stereo microscope. The pins on the CPU are on
0.050 spacing with a ~0.025 gap so its really easy to bridge two pins
together
when soldering (I found a bridge on mine). The microscope is used for
inspecting the solder joints for bridges and the dental pick is used to
probe
the pins to be sure they are all firmly soldered down, and to pry the pins
up
when de-soldering.

If there is any interest I will post details of this upgrade, so let me
know.
Happy scanning to ya'
MAD

Paul,
I use one of their dual band handheld transeivers (DJ580T) and am
quite happy with it. It has many features (this is the wrong place to
elaborate) and has held up quite well. They are very popular with amateur
radio operators here in the U.S. The dual band (2 meter/70 cm) feature
is quite nice.

I have heard of, but never seen one of their scanners. The advert
I saw wqas in the U.K. magazine "Shortwave".

The law is on the books. However, that means little. I do not believe it has
been tested in the Supreme Court. Nor is it likely to be, as the law is
impossible to enforce in the first place - and not worth pursuing prosecution
of anyone who decides to fight the charge in court.

Just a comment on the power supply.
18v is nothing to be alarmed about if you did the measurement with NO LOAD (i.e. not plugged into the scanner). Since there is no current drain on the supply, the voltage will be higher. When you put a load on it, it should drop down to the 13v range. You can pull the case of the scanner off and measure it while its plugged in.

Sorry I can't help on the main problem. It does sound like you may have some type of component failure.

Annoucing the creation of the Boston Amateur Radio Club World Wide Web
home page.

What is the World Wide Web? It is like the Internet, except consisting of
information instead of networked computer systems. The Web consists of
a variety of information all linked together, in no particular order, with
"links" to other information.

So, what is the address of the Boston Amateur Radio Club Web page?
http://www.acs.oakland.edu/barc.html

This doesn't look like a normal telnet or ftp address. How do I connect?
You need to use some new programs, possibly available on your system.

The graphically oriented program, called Mosaic, is most preferable.

The for non graphically-oriented users, you have a choice: www or lynx

(www is a program which does stand for World Wide Web, but not to be
confused with the Web itself :)

To use either of these two command-line programs, you would type:
lynx http://www.acs.oakland.edu/barc.html for the connection,
or similarly, for www...
www http://www.acs.oakland.edu/barc.html for the connection.

If you have any questions, are completely confused, and/or want to know
more, please don't hesitate to contact me at any of the addresses in my
signature file, or call me at the Northeastern University radio club
(local Boston area calls only, please): 617-373-4198

Don't blame Tandy for what happened to Allied. In in the late 60's it became part of Altec-Lansing, which was part of Ling-Altec, which was part of LTV Aerospace, which was part of Ling-Temco-Vaught, which gutted Allied for the cash flow. By the time Tandy bought it, there was little left but the name, and the Justice Department refused to let Tandy merge it into Radio Shack.

So, blame Jimmy Ling and his conglomerate for the destruction of a host of great companies.

(As to the Courtlandt Street radio row, if those terrorists had tried to blow up the World Trade Center thiry years ago, I might have joined them.)

WATKINS-JOHNSON HF-1000

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.

Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm beginning to think that anything larger is too

cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING

*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost! (these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad

frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was

pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to

sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio

a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65 17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still don't know why Radio Shack discontinued it. If you're looking for a good starter shortwave radio and can still find one laying about at a Radio Shack store priced to move, GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee and I did not know if I would like the hobby or the radio. Good points: direct-entry tuning, 36 station memories, fairly small so it is easy to travel with, speaker sound was good, reception was okay, but improved dramatically with the addition of the Radio Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning steps, only major broadcast bands tunable (large gaps between bands), selectivity not so good, no fine tuning, no BFO, no SSB or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company. The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.

Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All

in all, this radio gave me the best price/features/size ratio
of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I
purchased this little radio. Sure, it's not top shelf, but it's
suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour
clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for the R-70 and later R-71; they also offer a version for the NRD525. I have the R71 version. It is a synchronous detector which allows selection of USB or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the R71 local oscillators (I forget which one, probably the BFO) to the AM carrier. It contains its own product detector. The lock range is not very large, perhaps +/- 20 Hz. The detector seems to have lower distortion than the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S iaN amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may

be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can
swing the 450's sister model the TS690,you can recieve all the way to 60 mhz.
When the 5000 is put out to pasture,if it's replacement is the 450 without the
transmitter,it will be very tough competition for the other makes.All it needs
is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog
fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch
but it really doesnt matter much.Of all the recievers I have owned,or ad over
here to play with,it is the most sensitive in the SSB modeI have the
standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great
for RTTY or CW(if you are truly desparate!)The "protection"diodes have been
removed due to intermod from a local AM station.The reciever's case,front and
back panels are made of Aluminum,no plastic to crack on the 515!The audio in
AM is very bad,almost as bad as the Icom R-71a,but in a different way.The
audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack
but still a little "fuzzy".In the SSB modes,the audio is pretty clear and
doesn't fatigue me like the Icom dos far as thergonomics goes,it's
almost prefect!All the knobs are the right size,the tuning knob is large and

has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big
and easily seen across the room.Dynamic range is very good after the diodes
have been clipped(a one minute operation).The filters all are good quality
and have good shape factors.This was the first "affordable"rig that had a
memory option that was worth something with 24 or 96 channels available.
The NDH-518 I have(96 ch.)is also made totally out of cast and sheet
aluminum and matches the 515's styling.It stores frequency only,unfortunatly,
due to the year it was designeIm guessing.There are lots of these recievers
floating around on the used market for about $600 or so.Universal seems to have
a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely

sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the

"analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable

in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF

receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In the AR3000a it has been replaced with a (I guess optically encoded) smooth one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of

the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on
the cpu board.

It sounds like a neat idea but I'm not sure if you could make much off it for the public. There is lots to monitor in San Jose. It is not too dificult to montor from Moragn Hill to Palo Alto, and even a bit further north from a central San Jose location with a roof mount antenna. You can also pick up many East Bay cities. With your location, you could get Santa Cruz, more of Oakland and who knows what else. It would be useful for monitoring some of the low power applications, but I think people would really only be drawn to the service if there was some disaster like the Oakland fire, that they couldn't get by themselves. In this case, having only one phone line (only one person can control at a time), might make the other 50 people trying to dial, a little upset.

Newsgroups: rec.radio.scanners
Subject: ICOM R1 Forsale $400
Summary:
Followup-To:
Distribution: usa
Organization: BFEC at GSFC, Greenbelt, MD
Keywords:

Well I just bought this scanner about 3 months ago
and now my car took a crap. I paid $479 from
mail order less than 3 months ago. It is in brand
new condition, with antenna and charger. If your
looking for a new scanner! but don't want to pay
the full price , here is how you could save $80.
E-Mail responces please. My price is firm.

Handheld
100khz -1.3ghz
scan .5 5 10 12.5 20 30 50 hz
built in nicad
charger
antenna
brand new in box
$400

I wish I didn't have to sell because this scanner picks up alot that
the pro 43 can't touch! But I have a pro 43 also and you see which
one I'm willing to part with. Scan on!

Many times unregulated power supplies will read a higher than rated voltage
without a load on them. Measure the voltage again with the scanner
connected and turned on.

Source record: 273330

I am considering installing a hilltop scanner base station for my use. It would basically overlook the SF/SJ bay area. Based on the Icom R-7000, this would allow me to dial into the receiver, enter the desired frequency and passband with DTMF, and hear the audio passed back over the phone line. This unit will be installed at a commercial repeater site that I manage. The view (both RF and visual) is exceptional!

What I'm curious to find out is if there would be a market for such a service. I can see it as useful in hearing distant cities, listening to low power signals (or repeater inputs), or possible DF'ing with additional hardware. Would you consider it worth:

1) A fixed monthly fee with so many "free hours" of use

$_____/mo with _____ hours free

2) A per-minute charge with no monthly fee

$_____/min

BTW - the dialin number would be a San Jose phone prefix. Only one person could use the system at any given time, so it would be possible to get a busy signal.

Source record: 273326

I've decided to get an OptoElectronics M1 frequency counter, but the one thing that's stopping me from acting immediately is the price. At $239 + antenna + shipping, the price comes close to $260. The best deal I've heard about was someone at a hamfest who was able to pick one up with antenna for $209. I've called around and can't seem to do any better than $260. I suppose I'll probably hold off until I get a chance to go to a local hamfest or flea, but it makes me wonder why there seems to be no price competition on this product? What's happened to (lower profit per item) x (higher volume) = greater profits?

Brad:

The "Nasa" repeater is 146.64 Mhz, if I remember right. Shuttle mission re-broadcasts are available there when a mission is active. This repeater is located in the Clear Lake/NASA area (442.5 also re-broadcasts NASA. Tone is 123.0)

There are many repeaters down here, and for the most part, everyone is well-mannered. Try 145.47, which is operated by my club, the Brazos Valley Amateur Radio Club. There's no tone, and you'll find lots of friendly folks there (you're also welcome to join our net Monday night at 9:00pm if you can. Newsline is a part of it). Another repeater with GREAT coverage 146.88 (tone 103.5). This repeater probably has the best coverage in the area for a 2-meter repeater. It's hard NOT to hit it!

If you need autopatch access, The ECHO Society operates a repeater on 147.08 Mhz. It has an open patch. Let me know if you'd like to use it, and I'll send you the access code.

Good luck with your trip!

As of today, mid/late June is now the anticipated first delivery. A
little more info on the Computer Side has arrisen and looks like it
will cost in the region of 100GBP (In the UK) to obtain the
necessary CU-8232 interface and software but don't expect it
before until towards the end of the year, as to anyone producing a non-AOR
badged computer control system I guess we'll have to wait and see.

In the mean time:-

19 May 1994.

The following "blurb" is taken off AOR latest (first) information sheet on
the new AOR AR8000 handheld receiver. As of this date "sometime in June" is
the anticipated delivery but we are talking AOR here so don't start holding
your breath just yet. Price is also still undisclosed.

++
The AR8000 is the result of AOR's long term ambition to produce a new breed
of radio receiver which combined full computer compatibility with advanced
wide-band radio receiver technology. With the introduction of the new
AR8000, AOR have broken the mould of conventional radio receiver design.

At first glance the AR8000 in its static form may look no different to any
modern hand-held scanning receiver, but the similarity ends there...just as
soon as the receiver is switched on!! Initially you are greeted with the
opening welcome message on the AR8000 multi-function liquid crystal display
"WELCOME TO THE WORLD OF AR8000 RECEIVER", in a similar way to a sign on
message displayed by your personal computer. This new experience immediately
demonstrates to the new user and discerning radio listener that the AR8000
is no ordinary radio but THE NEW CONCEPT in radio design. The modern new

cabinet design measures approx. 152mm (h) x 69mm (d) x 40mm (w) excluding projections and weighing only 350g including NiCads (but not aerial).

The AR8000 is a highly sensitive hand-held receiver boasting a very wide frequency coverage of 500KHz to 1900MHz without gaps in the range (actual acceptable frequency input from 100KHz). Step size is programmable in multiples of 50Hz for smooth tuning. The all mode reception provides AM,USB,LSB,CW,NFM and WFM. As you might expect from a radio receiver of this calibre, an independent 2.0KHz SSB filter is fitted as standard and the USB/LSB modes use true carrier re-insertion with correctly calibrated frequency read-out (not offset by 1.KHz). A custom manufactured ferrite bat aerial is neatly installed at the top of the receivers cabinet to enhance receive performance when listening in population centres to Medium Wave services or when commentary is provided at aishows and motor sport events.

The highly visibility LCD is of a new dot matrix format which enables many new facilities to be used, many of which have never been seen before especially on a hand held design. Two VFO frequencies may be displayed on the LCD simultaneously, one providing a stand by frequency available for quick transfer (similar to commercial aviation built-in radio transceivers. When frequencies are entered, ALPHANUMERIC comments may be stored along with frequency, mode & attenuator status simplifying the job or recalling and identifying memory channels.

The LCD provides four lines of display so that additional facilities may be provided and displayed at the same time, these include a signal strength bar meter and a band-scope showing band occupancy.

The AR8000 is equipped with almost every conceivable operating feature but operation remains easy thanks to a massive new microprocessor. A total of 1000 memory channels are provided which are divided into 20 banks, each having 50 channels. AOR have chosen to allocate 50 channels per memory bank (rather than the more conventional 100) based on findings that most radio listeners prefer fewer channels per bank but more banks for simplified operation. The AR8000 will search and scan at a very respectable (and fast) maximum speed of approximately 30 increments per second. You may even enter "special" frequencies into memory banks where they may only be recalled by entering a user definable "PASSWORD"....this will stop preying eyes.

The AR8000 is truly a button pushers delight but operation need not be difficult. As well as a comprehensively illustrated operating manual and UK quick reference guide, the AR8000 has two operating modes: NEWUSER and EXPERT. As already mentioned, the multi-function LCD provides many new facilities but the receiver has a few more tricks up it's sleeve. Not only can you connect the AR8000 to an external computer for remote control, you may connect two AR8000 receivers back-to-back so that data may be copied from one to another (small interface required for remote data access). There are a variety of scan/search commands to link banks, scan by mode, programmable delay scan, priority, auto memory store, step offset and a programmable power save circuit to increase duration of operation from the NiCads.

The mechanical assembly of the AR8000 will be a sheer revelation to any radio engineer. Surface mount technology has been employed throughout the receiver which is constructed of plug in modules. This will ensure the highest levels of performance, reliability and serviceability. The AR8000 will certainly stand out in a constructional beauty contest. Keypad illumination extends to the side panel keys and may be switched in a number of ways. Illumination "permanently on" for mobile operation is possible. A specially selected heavy duty regulator has been fitted to ensure the receiver will continue to operate reliably even with the illumination permanently selected.

MAIN FEATURES
Frequency coverage 500KHz - 1900MHz
All mode reception AM, NFM, WFM, USB, LSB & CW
True carrier re-insertion and specific SSB filter with non offset readout
1000 memory channels
20 search banks
Priority Channel
Frequency Pass
Rotary Tuning Dial
Step sizes programmable between 50Hz - 999KHz in 50Hz steps
Scan & Search speed up to 30 increments per second
Signal Strength meter
Band Scope
Backlit LCD , Keypad & side panel
Battery save facility
Separate controls for volume, squelch & dial
Attenuator
Keypad Beep on/Off
Keypad Lock
Top panel 3.5mm earphone socket
Monitor switch
Password protected banks
Programmable Scan & Search including Free, Delay, Auto, Level & Mode
Select Scan List
Clone (Copy) Data facility between two AR8000
Computer Control
Tape Output
EEPROM memory backup (no battery required)
Supplied with NiCads, charger, Hand Strap, Belt Hook & screws, earphone, seem flexible aerial, DC lead with cigar plug
Comprehensive operating manual with over 50 illustrations & quick reference

SPECIFICATIONS
Frequency Range: 500KHz - 1900MHz

Receive Mode: AM, NFM, WFM, USB, LSB & CW

Step Size: 50, 100, 200, 500Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50, 100, 200, 250, 500KHz or any multiple of 50Hz upto 999KHz

Sensitivity: 500KHz - 2MHz
SSB by field signal strength

AM by field signal strength

2MHz - 30MHz
SSB 1.0uV
AM 3.0uV
NFM 1.5uV

30MHz - 1.3GHz
SSB 0.25uV
AM 1.0uV
NFM 0.35uV
WFM 1.0uV

1.0GHz - 1.3GHz
NFM 1.0uV

1.3GHz - 1.9GHz
NFM 3.0uV
AM/SSB S/N 10db
NFM/WFM SINAD 12dB

Selectivity SSB 2.0KHz (-6dB) 7.5KHz (-50dB)
AM/NFM 12KHz (-6dB) 25KHz (-60dB)
WFM 180KHz (-6dB) 800KHz (-50dB)

Antenna Impedance 50 Ohm
AF Output (4.8V) 120mW (8 Ohm)
Power requirements: 4.8v NiCad / 6.0V Maganese / 9 - 16V DC external
Consumption: 150mA (nominal), 100mA (stand by), 20mA (Save)

Memory Channels: 50 channels x 20 banks = 1000
Pass Channel : 50 channels x 20 banks = 1000
Scan/Search Speed: Approx 30ch/per sec

++

I was in Radio Shack this afternoon to see if they had any frequency counters. The stor was really busy and didn't get a chance to get a look at the one that was on display behind the counter. The thing that caught my eye was the price: $99.95. Is this true anywhere else? I thought about purchasing it on the spot without knowing much about it, but the store was too full. Has anyone else seen this price, and would this be a good counter to buy? I couldn't get a close enough look at the number on it, but I can't imagine they make too many models.
Thanks inadvance for any reply and help.

>kind of rushed into the purchase in order to get complete cover (100KHz thru
>2060MHz straight thru)

I had a Camnis HSC-050 which is the same radio. I ended up selling it because, out of four handhelds, I didn't think I'd be using it as much as the others.

Compared to the older AR-1000 and AR-1500 I think it's a better radio. It is much more sensitive and the user inferface has been VASTLY improved over the other Nissei models. It tends to leak CPU noise into some regions of VHF-hi, which can cause momentary false triggering of the squelch unless you set the threshhold higher. But the radio is so sensitive that you don't lose much by doing so. It also has some minor firmware bugs but you kinda expect this in every Nissei manufactured radio ... especially the first production run.

So, did you get a "half way decent scanner"? Definitely ... probabably better. Did you get the best continuous coverage handheld. No - the Yupiteru 7100 is better, and the AOR 8000 will probably be so too.

I need to know the transmit and receive frequencies in the GMRS band.
I have a handheld I'd like to program but need to know what
transmit freq's go with what receive freq's.
Please e-mail me the information.

I'm pretty sure Radio Shack is discontinuing the Pro-46,
so you may call them and ask what they are going for now.

I found that a good way to listen to the scanner while driving in the car is
to hook up a cassette adapter (intended for listening to portable CD players)
to the earphone jack of the scanner. This way, you can listen to the scanner
through your car stero amplifier.

4792. CA frequency database on Internet?

I have several friends with Alinco DJ-560's and other Alinco products. I have never seen a more upset bunch of radio owners! Problems galore with the limited exposure I've had... Stuff like the radio drifting 15kc off frequency and goodies like that. Tell your friend that he'll get what he pays for.

For the record I have had my Yaesu FT-530 Dual Bander for a year now and love it.

: Jonathan (of Javiation) posted a fairly lengthy press release on the features
: and specs of the unit. Did you miss it? I could repost if necessary.

May be a good idea to re-post as Jonathan would most likely be able to
deliver uncensored (full 800 mhz band) units -before- EDCO get's authorization
for their CENSORED version of the receiver. It would most likely boost
Jonathan's sales in any event.

BTW, can this receiver have an individual on/off delay on a per channel
basis? I heard it can be programmed by computer, how?

Cross-posted to: alt.radio.scanner,rec.radio.scanner

I now own a 220Mhz ham radio (handheld), and am planning to perform a mod
to extend its receive range.

I would like to know:

1) What Goverent/Military/Federal services operate within the 220 Mhz range,
and what modes (AM/FM/SSB) do they use?

2) Locally to the Eastern Mass. area, what services (any kind) use this
range. Also, what modes?

Thanks much for any responses.

I'll place a summarized response (assuming I get enough) into the
/pub/hamradio/docs/misc area of the Boston ARC anonymous FTP area on Oakland.

Scott

>Ryan Rudnicki
>rr03@academia.swt.edu

I have one and I really like it. It's easy to use, just select the state you're in and it works. It picks up all police freqs below 600 MHz (that's most of them). I live in Colorado and couldn't find any information on the car repeater freq to put in my scanner, but the Beartracker does pick it up. I USUALLY get a good warning before seeing a CO Hypo cruiser. It's also good for just monitoring the Hypo's, Police, DOT, and WX. I highly recommend it for the DAK discount price. I bought mine through Damark (refurbished) for $129.

Why intentionally slow the scanner? The same reason you intentionally limit
the number of memories. The RS 200X scanners can be modified for marketing
reasons. The manufacturer can easily "upgrade" the scanner is a year or so by
removing diodes. I don't think RS wanted the public to know about these mods.

Folks... I have a friend who is a Secret Service agent. He tells me that
the Secret Service DOES, indeed, get assigned to follow and protect
foreign dignitaries while they are int he US. The Secret Service also
protects the exterior/perimiter of foreign embassys in Washington, etc.
There are several divisions of the Secret Service such as 1) Uniformed
Officers; 2) Special Agent (plainclothed); 3) White House Officer.

: I am considering installing a hilltop scanner base station for my use.
: Based on the Icom R-7000 ... this unit will be installed at a
: commercial repeater site that I manage.

If the receiver was of commercial quality, one might stand a chance of hearing something useful. The R-7000 was not designed to operate in a high-RF environment like a commercial repeater site. It gets even worse when broadcast (especially television) users are co-located. Even if the other transmitters on the site aren't heard directly (on frequencies where the R-7000 shouldn't hear them), the probability of the receiver front-end being "blocked" by overloading is high. If you haven't done so already, take the R-7000 up the hill and try it during the daytime on a weekday and see what can be heard. I think you'll be unpleasantly surprised. ;(

On the other hand, if the site is sparsely populated, you might get away with it to an extent. Most of the 450 and 860 and 930 bands will likely be unusable in any event.

All of the above is IMHO, of course. It's a great idea - perhaps the monitor receiver people will come out with a does-it-all unit that _also_ has a good receiver. I haven't seen one yet that is within monetary reach of most hobbyists (or many commercial operators).

Good Luck, though. Maybe the non-ionizing radiation fairy will smile on you! :))

I have a new neighbor who has been into scanning for quite some time. She listens to the local police and some medical but is limited by her current equipment. She is using a Radio Shack Pro-2009 made in 1984. This scanner only has an eight channel capacity.

Anyone know of mods to increase channel capacity?

Thanks for the assistance.

Brian

The UHF Fire frequency 457.300 which disappeared recently in Wellington
has in fact not been used by the Fire service for several years but had
not been decommissioned so that the cross link to the Fires VHF channel
was left in place. The frequency has now been reassigned to a Taxi Co.
The Frequency 457.450 (Normandale) is in the same position and could
disappear at any time.

> 1)What are the specific frequencies in the GMRS?

GMRS - General Mobile Radio Service

Base/mobile repeater I/P

462.5500 467.5500
462.5625
462.5750 467.5750
462.5875
462.6000 467.6000
462.6125
462.6250 467.6250
462.6375
462.6500 467.6500
462.6625
462.6750 467.6750
462.6875
462.7000 467.7000
462.7125
462.7250 467.7250

In addition to the station's licensed channel, 462.675 may be used
for emergency and traveler's aid by all stations.
Interstitial channels (462.xxx5) may be used only in simplex mode
with voice transmissions of no more than 5 watts.

> 2)When you transmit on one frequency and recieve on another (using a
> repeater) is there a specific way the frequencies are paired?
> Example in receiving on 453.425 or 453.525,what is the transmit frequency?

Note that the example frequencies are allocated to local government,
not GMRS. In the VHF bands (30-50 and 150-170), pairings are largely potluck.
In the other Private Mobile Radio bands in the US the mobiles are:

Band I/P frequency

4811. Exotic frequencies

Newsgroup: rec.radio.scanner
Date: 1994-06-09 08:57:59 UTC
From: srogers@uqac.uquebec.ca
Message-ID: <Cr4Gwo.82L@uqac.uquebec.ca>
Source record: 273372

Hi all,

I recently received my brand new Yupiteru MVT-8000 and immediately started to hunt the "new and unknown frontiers" of the frequency world.

Something completely new to me was the range of frequencies from 1KHz to about 148MHz. So of course, any signal I heard in those frequencies while in search mode was a great discovery.

Anyway, yesterday I was mozeying around in those frequencies, when all of a sudden I hear, faded in low noise and hissing interference, some sort of exotic music. "Gee", I say to myself, "This must be some far away shortwave station giving it's "call-sign" or whatever it's called (I'm new at this, so the precise lexicon has yet to be mastered). I push the search button, as the signal is weak, and lock once again on this strange but interesting music signal, on another frequency.

"Can't be an AM station", my brain tells me. "Nor an FM station". Gee, trying to understand how frequencies "align" in the spectrum isn't all that clear to me yet. I was on frequency 144.090 which the book tells me is ... 2 meters radio-amateur band. "Well, this is weird", I think to myself, "Who would want to broadcast music on this band?".

Intrigued, I decide to unplug the earphones, and WOW things get even weirder: I now get a kind of echo impression (you know like when you're talking with someone on the phone, your TV's on the same channel as their's and you can hear it with the 'phone' ear and the 'free' ear). "This is major paranormal stuff...", I rejoice, "Am I happy I got this scanner or what..."

And all of sudden, I kinda stretch out my ear to the hall where my husband has his home recording studio. He's a professional musician (does soundtracks for films and videos) and I see he's got his earphones on and he's working on some score. I can barely hear the music coming from the 'phones but realize that what I'm grabbing at 144.090 isn't an alien spacecraft or even a Paraguay or West India ham radio station, but crapshy leaking from his synthesizers a distressing 6 FEET away !!!!

Well, just thought I'd share that we you. If you've personnally experienced your home lamp, tv, heating system or otherwize exotic "frequency", please share it so I don't feel stupid AND alone...

Hesitating on posting my .sig.....

Ah well, here goes:

**** The time has come to rework my R-7000****

Form time to time I have heard of mods. for the R-7000.
I'm looking for any articles, Info, Drawings and anyone that has
Upgraded their unit.
Parts, test equiptment needed or complexity of the mod, is no
problem.
I have the serial interface for my MAC by RCSS. If there is any
better software out there I would like to know. Someone will have a
copy.

Thanks for reading my mail. Thank you for any help.

Mornig !

I would appriciate some help.

There is a Air Training Corps (ATC) that as a radio project want to get some
old military comms kit up & running . The intention is to build up a small
Net of local (?) ATC squadrons. I'm sure you'll agree that this sounds like
a great way of getting the lads & lasses into radio !

Kit we need info on:

RACAL 543 (British Communicatios Corporation) Txcvr (30 to 80Mhz).
COSSOR 109AB Txcvr (80 to 100Mhz !).

If anyone has /any/ manuals or info as to how they can get the kit fired up
please contact me here. I know its a tall order but here's hoping !
Thanks in advace.

Stuart.

rest of stuff deleted!

Not only was a salesperson judge but they would be convicted as well. My working mate at the store where I worked was threaten with termination because his names / tickets wrote ratio was too low. I believe at one point in time he was even disciplined by receiving an reduction in pay for a pay period. My impression during the year I worked for Tandy Land was names and addresses were the single most important mission to accomplish in the eyes of the management, almost to the point of being fanatical.

As for names being mis-spelled, back in the old days before point of sales computer, they data entry people were paid by quantity not time on the job....so what could one expect.

: Radio Shack employees are REQUIRED to maintain a percentage of 80% or
: higher names and addresses on tickets. Failure to maintain that number
: could result in termination.

: Radio Shack does not sell their mailing list, and they only send out
: flyers to persons who shop there frequently. And, Radio Shack is not
: the only company doing this. Sears has now started a similar policy.

Ordinarily, I would not mind this practice. HOWEVER, what seems to happen
often is that some salespeople have a habbit of making typos and this
results in you receiving multiple flyers in the mail. Then you have to
take in the incorrect mailing label(s) and request that they be deleted
from their system.

I've gotten into the habbit of saying "already on file". What I don't
understand is why they don't adopt some kind of customer card system if
keeping such a database is so important. One photography chain here in
Canada provides you with a card and you only need to give you name and
such on the first visit (actually the first visit to each store as they
keep separate databases, but most people usually go to only one or two
stores). On subsequent visits, you just give them your card and they
swipe it through their machine in order to print out the label film you're
having developed. This is more of a customer convenience as it saves
time, because they don't send out flyers like RS does.

Bob Parnass has quite a compilation of R7000 mods & tips. I haven't seen to much of him here lately, so if he doesn't post it, I will look to see if I still have an electronic copy. Icom issued a sevice notice that discussed building a new front end filter. You have to call Icom to get it. It was just a hand drawn circuit that looked pretty hairy. So far I haven't met anyone who has it installed, so I haven't performed the mode yet. I did the scan speed up and the remote control button swap (move a diode). I also added a heat sink and a cooling fan (which I have since removed because of the noise).

: This is a GREAT idea.

: What make and model adapter, and availability?

I've got a Recoton CD adapter that I bought from a local Meijer store.
It really does work well, but I would suggest two things:

1) Get one of those little plug-in thingys that makes the mono output of
the earphone jack play through stereo headphones. Otherwise you only get
output out of half of your speakers. This isn't too bad for me, since
the Pro-43 I've got plays out of the left channel- on the driver's side.

2) Don't drive around with the top down on a convertible while doing
this. A friend and I decided to go 'cordless phone hunting' in my car
one night, and that's when I came up with the idea of plugging the CD
adapter into the scanner. Worked great until I realized we were in a
quiet residential neighborhood at about 10 o'clock at night, and we were
broadcasting someones conversation for about a block... :-{

4825. IDEA: (if we're still doing this ;)

Newsgroup: rec.radio.scanner
Date: 1994-06-09 14:28:58 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <2t78va$n72@slinky.cs.nyu.edu>
Source record: 273295

1. Copy regional map data down from a CD-ROM similar to AutoMap, but create an .exe that accepts lats and longs from a database and shows dots on the screen where antennas are located. Color the dots red, yellow, blue, or black based of the service field being fire, rescue, police, or business. Allow the user to select the combination of the colors that are shown. Then, when the (formerly) HB-232 enabled scanner sends the frequency to the computer, blink every dot that transmits on the frequency currently being received. Of course, certain freqs are used by herds of agencies, like 155.340, but perhaps a combination of signal strength from the scanner and effective radiated wattage from the database can be used together to make the computer guess where it's coming from.

2. Ever see those moving maps in car dashboards with CD-ROMS in the arm rest? Build a scanner into the car, keep the related FCC database data on the same CD-ROM as each regional map, and do the dots thing again. Except here, the scanner should auto adjust what it's monitoring based on your current location, and only show the antenna sites of the agencies it's currently monitoring. Also allows selection between public service agencies and business bands.

I forgot the third.. oh well.

I have the DJ560 VHF/UHF transceiver and am happy with it. It is not a
scanner though. From what I've heard, the Alinco scanners aren't very
good. For an inexpensive model, the Pro43 works. For me, I had to go
top of the line and get the Yupiteru MVT-7100.

What, no infra-red beaming between scanners? :-)
Seriously, though, despite the wonderful sounding specs, I'm a bit
concerned about the very wide selectivity on AM. Could make SW
broadcast listening rough unless you switch to SSB.

I think I have asked this question before, but no answer.

Aside for the D502 and D503 thing (extended coverage and scan
speed) I noticed that there is also a spot for a D504 (hope I have those
numbers right) which is evidently installed in some non-US versions of
the radio. Anybody know what this does?

HAMFEST/COMPUTERFEST CALENDAR 1994 - NORTHERN ILLINOIS
last updated June 9, 1994 |

o Please report additions or changes to Bob Parnass,
AJ9S, office phone: (708)979-5414, electronic
mail: parnass@ihlpf.att.com.

JUNE

June 5, Sunday: Princeton, IL - Starved Rock Radio
Club. Bureau County Fairgrounds. Admission $5.
Talk-in 146.355/955. Info, Bruce Burton, KU9A
(815)795-2201.

June 12, Sunday: Willow Springs, IL 6 Meter Club Ham-
fest, Six Meter Club of Chicago. Santa Fe Speedway,
91st Street and Wolf Road. Admission $5. Gates open
6AM. Talk-in on 146.52 simplex or 146.97 repeater.
Info, call Joe Gutwein, WA9RIJ, at (708)963-4922.

JULY

July 24, Sunday: Stickney, IL - DuPage ARC hamfest,
Hawthorne Race Course, 3500 South Cicero Ave. Handicap
accessible. Starts at 6 AM. Talk in on 142.25 MHz
with 107.2 PL. (-600). VE Testing 9 - 12. Advance
tickets are $4.00, $5.00 at the door.

This hamfest used to be held at the American Legion in
Downers Grove and was a good small to medium-sized ham-
fest. This year, there will be a 30,000 square foot
indoor exhibit area in an air conditioned building,
plus outdoor tailgating.

For advance tickets, send check payable to DARC,
enclose SASE, and send to Hamfest 94, 7511 Walnut Ave,
Woodridge, IL 60517. For commercial or fleamarket
tables info, call 708-985-9256.

July 31, Sunday: Sugar Grove, IL - Fox River Radio |
League (FRRL) Hamfest, Waubonsee Community College, |
Route 47 at Harter Road, 5 miles NW of Aurora, IL. Set |
up Sat 7 PM, Sun 6-8 AM, open to public 8 AM. Commer- |
cial dealers, flea market, computer vendors, refresh- |
ments. VE session: 10 AM (bring original license, a |
copy of license & photo ID). Free parking, camping |

nearby. Talk In on: 146.58/147.66. Adm: adv $4, door | $5. Table: 8 ft $10. For advance tickets and informa- | tion contact: Fox River Radio League, Box 673, Bata- | via, IL 60510-673 or call Diana Skube, WD9API (708- | 293-7485), or Mark Hougaard, KB9FCC (708-810-1805).

July 31, Sunday: Racine, WI - Racine Hamfest, Sponsor: Racine Megacycle Club - W9UDU South Hills Country Club, East Frontage Rd. I-94 Between Hwy 20 & K. Advanced admission SASE & $3.00. Send to: RMC P.O. Box 3 Racine, WI 53401. Information: 414-554-7565 - WB9USI

AUGUST

August 6, Saturday: Goshen, IN - Elkhart County Ham- fest Sponsor: Elkhart County Radio Association Elkhart County 4-H Fair Grounds. 8AM to 3PM Advanced Tickets (till 7/1) $4.00, $5.00 at Gate. Send Ticket Requests or Table Reservations to: Elkhart County Hamfest, 20294 C.R. 36, Goshen, IN 46526 Information: 219-533-7632 - Jocelyne WZ9M

August 7, Sunday: Peotone, Il - Hamfesters Hamfest Will County Fairgrounds, Peotone, Il. Take I-57 South to Peotone Exit 327 (East). Flea market open 6:00am - 3:00pm. Tickets $4.00 advance w/double stub & $5.00 at gate w/single stub. No additional charge for flea market space. For advance tickets and information con- tact: Hamfesters Radio Club, Box 42792, Chicago, Il. 60642 or call Amateur Radio Info-Line: 1-708-535-AHAM

August 28, Sunday: Woodstock, IL - Tri-County Hamfest, Sponsor: Tri-County Radio Group, Inc. McHenry County Fairgrounds, Rte. 47 Junst North of Rte. 14. (Only 14 miles North of I90 on Rte. 47.) Advanced Tickets: $4.00, At The Door: $5.00 For advance tickets send check to: T.C.R.G., P.O. Box 3107, Skokie, IL 60076-6107 Information: 708-658-1678 Talk in on: 146.52

SEPTEMBER

September 11, Sunday: Joliet, IL - Bolingbrook ARS Ham/Computerfest, Inwood Recreation Center, 3000 W. Jefferson. This is a medium size hamfest with indoor/outdoor flea market. Gates open 8 AM for gen- eral public. Outdoor flea market on paved lot -- setup at 6 AM. Use Exit 253 from I55, or Exits 126/130 from I80. Admission $5. VE testing 9 AM - 12 noon. Bring original license and photocopy, ID and photo ID, plus $5.75 test fee. Novice-only tests are free. Talk-in 147.33, 224.54, and 443.525 MHz repeaters. Indoor

table reservation, call Ed Weinstein at 708-085-0527. Info, BARS Hotline (708)759-7005 between 6 AM and 9 PM.

September 17-18, Saturday & Sunday: Peoria, IL - Super-fest. Admission $5. For more info call (309)685-6698. Talk in on 146.76 (-600 kHz offset).

September 24-25, Saturday & Sunday: Grayslake, IL - Chicago FM Club, Ham Radio Expo. This is a large ham-fest with indoor and outdoor flea markets. Lake County Fairgrounds, Rts 45 & 120. 6AM - 6PM. Info 146.76 MHz (-600). Admission $6 at gate, one ticket good for 2 days. Kids under 12 free.

OCTOBER

October 23, Sunday: Waukesha, WI - Kettle Moraine Ham-fest Sponsor: Kettle Moraine Radio Amateurs Waukesha County Exposition Center Forum Building, Highways J and FT All orders MUST be accompanied by a SASE and mailed to: KMRA Swapfest, P.O. Box 411, Waukesha, WI 53187-0411 General Admission - $4.00 ($5.00 at the door)

NOVEMBER 1994

November 19-20, Sat.-Sun.: Fort Wayne, IN - Fort Wayne Hamfest Sponsor: Allen County Amateur Radio Technical Society (ACARTS) Allen County War Memorial Coliseum Exposition Center Admission: $5.00 (No advance ticket sales.) For information or table orders, send a SASE to: ACARTS, P. O. Box 10342, Fort Wayne, IN 46851 or call John Rufner at 219-483-6305 (table info) Don Gag-non at 219-484-3317 (general info)

Nov 27, Sunday: Wheaton, IL - GMRS of Illinois May Fest '94. Admission $5. Starts 8 AM. Setup 6 AM. Info, call (708)690-1492.

COMPUTERFEST SCHEDULE

September 17, Saturday: Kankakee, IL - Computer Fest 1994. Sponsor: Kankakee River Valley Computer Users' Group. Kankakee County Fairgrounds 9:00 a.m. to 3:30 p.m. Admission $4.00. Information: 815-935-8590 or 815-935-1605>

Computer Central, College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547 $5 with card Normal admission $6.00 Opens 9:30 am - 3:00 pm

05/22/94, 06/26/94, 07/31/94, 09/18/94, 10/30/94, 11/27/94

Orland Park Computer Show held at The Orland Park Civic
Center, 147th Street & LaGrange Road, Orland Park, Il.
9:30AM - 3:00PM. Call 708-974-3123 for information or

Don't forget you can use your Silent Play (from RS) and just tune in your
scanner on the FM radio! No wires hanging from the radio.

I assume you were in Canada while doing the above :-)

Anyway, the reason you only hear half of the conversation is that the local switching office does not always feed the cellular callers voice back to himself (known as side-tone or "battery"). So if you only hear one side, it is the guy who's signal is originating from the landline and not the guy who is in using his cell phone in the cell you are monitoring. So there is nothing you can do except try picking up the input 45MHz lower (this usually takes a good antenna since power output is less than 1 watt on most phones).

The list of states which prohibit scanners in vehicles is only
about 6 or 7, and all of those states specifically exempt hams
from those laws. Likewise, the FCC resently issued an ruling
which preempts ALL state and local legislation that would
in any way prohibit the use of ham radio transcievers in
vehicles, etc.

Hope that helps.

Hi,

I'm travelling to the Sunnyvale/Silicon Valley area for 2-3 weeks
and I'd like any freqencies that you may have for that area. I'd
like police,fire,emergency,amateur radio, US Gov't., railroad,
military etc. I'd also appreciate the frequencies for Tandem
Computers. Frequencies for Modesto and the general Bay area would
also be appreciated.

73 and TNX,

|> I've got a Recoton CD adapter that I bought from a local Meijer store.
|> It really does work well, but I would suggest two things:

I picked up the Radio Shack version, snipped off the stereo adapter, and
bought a you-solder-it-on mono miniplug adapter and soldered
all four leads to the respective two points. Still works like a charm
7 years later(!). Besides, I always found that too many adapters put too
much strain on the jack. The worst of which was with my first scanner,
a bc100 with a supermini plug. For high ambient noise, I needed a
supermini to mini adapter, a mini mono to mini stereo adapter, and
then a mini stereo to 1/4" stereo only to have my humongous full size
headphones plugged in. I used to tape the adapters to the ducky because
the weight of them made the jack go bad.

|> [...] and we were
|> broadcasting someones conversation for about a block... :-{

No problem, unless you hear them calling the cops on you! :)

Speaking of sounds from the car, I got some weird looks from people
in line at the ATM when the township plectron started going off in my
car last weekend. I use the five inch outdoor Radio Shack horn
mounted at my feet for my in car audio.. ears bleed at 7 on the
dial, even with 2-80 air. ;)

It is really good for satellite work such as INMARSAT, SCPC or FLTSATCOM.
It is a bit lacking as a scanner, the HF selectivity is pretty bad
but it does have good sensitivity over the entire tuning range. It does
have three antenna inputs, one for HF, another for VHF/.UHF and the third
for microwave. This is a very good feature which allows three different
antennas to be connected to it concurrently.

No other scanner in that form factor has this feature to my knowledge.

No computer interface, 1khz is the tuning resolution, and it does not
support SSB or CW as previously noted.

I own 2 of them and would like to have a third if that is helpful.

Source record: 273293

Hi, I'm new to the world of scanners. I have been monitering
this group for a while...(monitering a group of monitors?)
Anyway, I have heard good things about the 200xlt, but I also
see references to it being "outdated" and an "old beast".
I am looking to spend about, ummmmm... lets see... say 200-300
dollars for a handheld. I'd like to be able to listen to drive thru
freq's, police, military, etc. All of that stuff! And maybe, just
maybe a cellular conversation here and there. (Although snooping into
people's personal lives is not something I'm really into).
Is the 200xlt the scanner for me, or is there a better one in
my price range?
Thanks in advance for putting up with another one of these silly posts...
I know how sick you people must get of seeing them...
Thanks again!

Some cellular bases suppress the sidetone, so you don't hear the mobile
part of the conversation. There's nothing wrong with your scanner, and
nothing you can do about it.

4850. GMRS FAQ

Newsgroup: rec.radio.scanner
Date: 1994-06-10 00:43:01 UTC
From: strech1@aol.com
Message-ID: <2t8cul$isk@search01.news.aol.com>
Source record: 273299

To jkwiatkowski@attmail.com (John Kwiatkowski)

I. What is the GMRS ?

The General Mobile Radio Service (GMRS) is part of the Personal Radio Service, and falls under part 95 of the FCC regulations (subpart A). The Personal Radio Service is intended to give the general public access to portions of the spectrum for various uses. Citizens Band (27 MHz) and model radio control (RC) are also part of the PRS. Unlike other land mobile services, the GMRS is available only to individuals. There are few restrictions on what the GMRS can be used for.

Consisting of eight channel pairs in the middle of the UHF land mobile radio band (450 to 470 MHz), the GMRS resides in what is most likely the most expensive real estate in the world.

II. A brief history.

The GMRS used to be known as the Class A Citizens Band. For a long time the high cost and scarcity of UHF radio equipment kept the GMRS beyond the reach of most individuals. Since few individuals were actually using the GMRS, the FCC allowed commercial users on the band.

Over the years a few radio products targeted at individual GMRS users appeared, but none were a big success.

Things have changed dramatically. Several generations of solid state UHF equipment have now come and gone, and reliable commercial gear is both affordable and practical. As businesses and government agencies migrate towards the 800 MHz band, well maintained used gear is available at most radio dealers and flea markets.

Recognizing the rapid growth in individual use, the FCC stopped licensing commercial users on GMRS channels in 1978. Businesses licensed in the GMRS before 1978 can continue to renew their licenses, but no expansion, modifications or license changes are permitted. Since 1978, commercial use of the GMRS has declined as individual use has steadily increased.

III. Who can use it ?

GMRS licenses are only granted to individuals 18 years of age or older. Partnerships, corporations, associations or other non-individuals are not eligible.

A great feature of the GMRS is that members of the licensees immediate family living in the same household are covered by the same license. There is no minimum age requirement for using GMRS. This is Family Radio!
There are few restrictions on what you can use GMRS for. Licensees (and their family) may use GMRS for any legal purpose, business or personal, except broadcasting.
It's important to note that businesses licensed in the GMRS before 1978 may continue to use it pursuant only to their originally licensed activity, and only employees of the business may operate their radios. Since only family members are allowed to use post-1978 licenses, new commercial use of the GMRS is effectively blocked. (A possible exception is the small business where all employees are family members.)

IV. Technical Details.

In general, the GMRS is operated and managed like the other land mobile services. GMRS license applications are submitted on FCC form 574, the same form used by part 90 (business and public safety) applicants.
Technical standards for equipment are essentially the same as well, the major exception being a 50 watt maximum power limitation in the GMRS.
There are eight primary frequency pairs allocated to the GMRS:

462.550 467.550 MHz
462.575 467.575
462.600 467.600
462.625 467.625
462.650 467.650
462.675 467.675
462.700 467.700
462.725 467.725

The higher frequency is used for repeater inputs.
As the rules now read, a GMRS license is granted for only one or two of these primary pairs. Additional pairs could be obtained by licensing different adult family members on different pairs.
The 462.675 channel pair has a special attribute: it may be used by any GMRS licensee for emergencies, civil defense or receiving or rendering travelers aid. You don't need to be licensed specifically on '675 to take advantage of this. This feature was implemented by the FCC to accommodate groups such as REACT (remember those guys who used to be on CB channel 9?). The 462.675 channel is monitored just about everywhere in the U.S., and national directories are available listing groups providing services to travelers. In northern California, REACT repeaters can be found on Mt. San Bruno, Monument Peak and Sacramento.
In addition to the one or two main channels you may be licensed for, family GMRS licensees may use any of the following seven

split channels in simplex mode with 5 watts maximum power:

462.5625 MHz
462.5875
462.6125
462.6375
462.6625
462.6875
462.7125

V. How easy is it to get a license ?

Fill out FCC form 574, send them $35.00 and wait 30 to 45 days. There are no tests, and no expensive frequency coordination or engineering studies are required either. Temporary operation while your application is pending is possible, see part 95 for details.

VI. What equipment can be used ?

FCC rules require that transmitters must be type accepted for use in the GMRS. Almost all type accepted commercial UHF (450 to 470 MHz) radio equipment is also type accepted for GMRS.
It is definitely NOT legal to use outbanded ham gear in the GMRS. Beside the legal issue, most 440 ham gear performs poorly above 450 MHz, and shouldn't be considered.
The rules state that the licensee is responsible for maintaining his GMRS own equipment. But like the other land mobile services, an FCC license is not required to make transmitter adjustments. If you have the equipment and background, you can maintain your own equipment.
GMRS rules require that all transmitting equipment be type accepted (and unmodified). Other station equipment such as receivers, repeater controllers and accessories must meet the technical standards of part 95, but need not be FCC type accepted. This gives the licensee considerable flexibility when putting a GMRS system together.
There are many sources of good radio gear that can be used on GMRS. New equipment is always nice, but there is so much used equipment available it's hard to pass up - if you're a savvy buyer and technically inclined. The ham radio flea markets are also a good source. Commercial gear has always been popular with hams because of it's reliability and availability of replacement parts. Most radio shops (see the Yellow Pages) take radios in on trade from time to time, and will be happy to set you up with a decent unit and a guarantee.
One issue to watch is whether radios are crystal controlled or synthesized. Synthesized units are more expensive, but can be programmed by a radio dealer to operate on your channel(s). Dealers will usually program a radio for free when you buy it, or change a nominal fee (typically $25) if you bring one in. On the other hand, crystal controlled radios require a pair of crystals

for each channel. Crystals cost between $15 and $30 a pair, usually require two or three weeks for delivery, and need to be fine tuned with a frequency counter when installed. Radio dealers have been known to charge $100 a channel for crystal installation. Unless you have the test equipment, experience and patience for crystals, the lower cost of these units may not be worth it. Another thing to look out for is how many channels a radio has. Since you can legally operate on up to ten different GMRS channels under a single license, you might want to look at radios with at least four to six channel capability.

VII. Who is using GMRS ?

Punch up any GMRS channel on your scanner and you'll hear lots of activity. During the day, expect to hear some pre-1978 licensees such as delivery trucks, security companies, etc. During the commute hours, you'll hear people calling home to find out what's for dinner, coordinating trips to the grocery store or chatting about how their day went. The '675 channel is especially busy during rush our in any of the major metropolitan areas.

VIII. Repeaters on GMRS.

Although all of the typical configurations are permissible in the GMRS (base stations, mobiles, control stations, fixed stations, pagers, etc), most GMRS users license themselves as mobile units and share a repeater. High altitude GMRS repeaters exist just about everywhere other transmitters are located. These sites provide excellent coverage over very large geographic areas.
FCC rules permit repeater owners to allow other licensees to use their facilities on a non-profit, cost-shared or reciprocal basis. You should be able to find a repeater with reasonable coverage for much less than $20.00 per month, in some cases as little as $5.00 per radio per month.
It should be noted that all GMRS repeaters use subaudible tones (PL) to control access. Digital Private Line (DPL) is in use on some repeaters in the Bay Area.

IX. Paging and Interconnect.

Voice paging is permissible in the GMRS (tone only or digital is not). Interconnection of GMRS transmitters to the Public Switched Telephone Network is not permitted. This means you can't use GMRS like a cellular phone.

Of course the fact that the R100 has three antenna inputs is one of the
nice features of the receiver that helps it have optimized front ends
for the various bands. Since your friend is more concerned about looks
than performance, why doesn't he just short the inputs together so he
has a single antenna and the performance of a cheezy AOR?

Hi Susan,

NOT stupid at all--it's unbelievable just WHAT'S radiating away out there.

My best "exotic" was back in my ham days. In New York City, on 15 meter SSB phone, I could hear a long-winded, mechanical sounding sequence of trills, squeaks, I-can't-describe-what "song" going on forever at around 21.4 MHz. Mind you, this was DIFFERENT from the usual cacophony of weird noises you often get on shortwave. I had this "tune" permanently etched in my brain, I listened to it so much.

The "transmission" remained a mystery until I had the privilege of touring the IBM 360/95 (when computers had CONSOLES) installed at the Institute for Space Studies a couple of blocks away. There it was, separate from all the other impressive hardware that made up the System/360, what was described as a "BOM tester"--a giant widget for diagnosing and testing the semiconductor memory units then being used. Its many console lights were flickering away in stereotypical computer fashion--to the same rhythm/tune as that song I had been hearing!

4860. Stupid Cell Phone call

Newsgroup: rec.radio.scanner
Date: 1994-06-10 04:16:24 UTC
From: craig@yonder.equinox.gen.nz
Message-ID: <H.eg.U_hixsbG8YA@yonder.equinox.gen.nz>
Source record: 273323

I just listened to a guy demonstrate total stupidity on his
cell phone about 10 mins ago. He was recording his message
on the cellular secretary service (it answers the calls, playing
back your message, then recording the callers like an answerphone
whenever you have your cell phone turned off), which was amusing
to listen to as he had about 6 goes at it before he was happy with
it, i.e. he was repeating his name and business, then, something
I couldn't believe, he went and changed his password on the service.
You key that in (Touch tones), and the service repeats the numbers
back to you for verification!
That meant I had the guys name, and password!! Wouldn't be too hard to
track down his cell phone number!

Craig.

>** Via the Aardvark Burrow BBS - 1-716-383-1372**

The question is who is going to enforce such a stupid law? The law
from back in 1936 is the most specific, and is more reasonable:

(to shorten it up a bit):

Its legal to monitor any transmission so long as the listener does
not reproduce (re-broadcast or record), and does not reveal the contents of
the information being recieved -- basically listens for amusement only.

This country is becomming _FULL_ of stupid laws -- why can't they
put some reasonable ones in the books?
Secondly -- why did it take congress/FCC so long to pass the
law on cellular frequencies? Most stuff is digital now anyhow, so the
point of removing those frequencies is almost a waste..
In my opinion, this is still America -- at least I hope.. to listen
and not use it for anything but fun should still be legit.

Some interesting rumors from CIS!

Subject: #SCANNER UPDATE! - Msg Number: 274242
From: Jeff Goldman 76703,4224
To: All
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 03-Jun-94 10:39:50

Here's the latest info from RS & Uniden (unofficially, of course <g>):

Fifteen of eighteen scanners in the new RS catalog will be NEW. That's up from the fourteen that were going to be new. The modifiable Pro2032 will be killed off and a revised unmodifiable version will be coming out.

Future Pro51s and Pro23s WILL NOT BE CELLULAR CAPABLE via the test mode! RS realizes that the July issue of Monitoring Times will no doubt have the test mode info and RS is sure that the FCC will act on it. So, Tandy has ordered Uniden America to delete the cellular test freq from those two scanners. THEREFORE, IF YOU WANT A CELLULAR-CAPABLE PRO51, GRAB IT NOW! You can use one of those 10% Off New Item coupons from a catalog until the end of June. Or you can use a Preferred Customer Card. Or get the scanner from Marymac for only $259 delivered.

I talked with someone at Uniden America today who knew about this "back door" method, but says that people shouldn't repeatedly go into the test mode since it's a reboot of the scanner and may blow the CPU. He stressed that the warranty doesn't cover this. Luckily, people with a Pro51 need only do this once.

The 1000 channel RS base is still on schedule to be available by the time the catalog is released.

By the way, I got unofficial verification from Uniden that the new scanner will be called the BC3000XLT and will have various fixes of BC2500XLT problems. I was told, however, that when Uniden fixed the battery drain problem (and evidently gave away free batteries) that they also fixed an "overload" (ie intermod) problem in the 400MHz range, as well as fixing the audio.

Finally, it turns out that the 6 BC220XLTs that were received by distributor Talley Communications in Northern California on Thurs Apr 28, and then by their 3 dealers the next day were not regular production scanners!!! Evidently, Uniden makes it a common practice to have a "60 day shakeout period" for new models to find potential problems. They figure that scanner nuts will be the ones to grab these and will immediately complain to the dealers about any problems, who will in turn tell Talley, who'll tell Uniden. My connection at Uniden said that NO changes were made to the actual production units.

So, Uniden has released the production SC150s, is about to release the production BC220XLTs, and will shortly be releasing the low end BC120XLTs.

The following uses a calculator to give you the 1/4 wave section
of a 1/4 GP antenna or "short" section of a J-pole. I use a
velocity of propagation factor of .91 and center frequency of
146 megahertz; for those with programmable calculators, assign
variables here :-)

(((((300 x .91) -:- 146) -:- 4) -:- 2.45) x 100)

Results in inches (19.08... in this example) for the 1/4 section.

For real fun use the expression with variables in a #DEFINE in
a c program and then pull the result out of the middle of some
string i/o functions later :-)

Cheers & 73

: portable CD players) to the earphone jack of the scanner. This way,
: you can listen to the scanner through your car stero amplifier.

Radio Shack sells such a gizmo; other stores that sell portable CD players probably do, as well. I'd be concerned about long-term operation of the cassette player. The pinch roller is rubbing against the capstan with no tape in between. This may be a non issue.

In some mail order catalogs though, I've seen gadgets like the recently discontinued Silent Play (another product from the folks you love to hate): An FM transmitter that plugs into your cigarette lighter socket and broadcasts your CD player or scanner into the car radio. The one I saw even had a pigtail with a power plug that mated to a CD player. I think most portable CD players run on 3 V, so that wouldn't work for a scanner, but you could rig something up. Fortunately, my scanner runs from 12 V so a direct connection to the vehicle electrical system is no problem. Who will be the first to go mobile with a Silent Play. (The Silent Play was an FM BC transmitter and receiver intended for use with video games, so parents could play Jurassic Park without disturbing the children. When Radio Shack dumped them for $19.95 a bunch of us bought them up, much to the amazement of Radio Shack clerks, many of whom had never heard of it. There aren't any left, I have none to sell and I don't know who makes anything like it, so please don't ask.)

Radio Shack also sells an amplified speaker that works well with my portable scanner. It even shuts itself off after a brief period of no signal, only to reawaken when something happens. I find a single speaker on the console makes listening easier than stereo speakers on the sides. Plus, I can listen to Beethoven and the Newington PD at the same time. The Radio Shack DSP filter/amplified speaker looks like a worthy replacement to this setup, but I haven't wired up the cigarette lighter plug yet.

What'll do when manufacturers stop putting cigarette lighters in cars? Okay, wire directly to the battery on your car, but what about rentals?

Good listening.

Jim

It would be very hard to defend a prohibition on monitoring signals
that are travelling through public property and through your own
body even. Cell phones transmit "in plain sight" - they should
use (SIMPLE TO IMPLEMENT) encryption if they want privacy, just like
the men in blue nylon.

I will listen to and record cell phone converstations and love
every minute of it until they aren't beamed around the city
for me to hear.

There are 2 places that I have seen sell cell tracking boxes. One in Canada and the other in Wisconsin (I think). The box costs about $450. I think I remember Richard Crisp selling one a while ago, so maybe he has experience with it. It allows you to track phone calls from cell to cell because the control data is on the same freq as the audio (that little chirp you hear just before the call switches). The software from the show did not come from a BBS, but there is a simulation program that is on a BBS, so maybe thats what he was referring to. I had the demo software at one time, but don't know if its still around. I think saying that the software came from a BBS is just media scare-tactics: trying to make people belive that anyone can download this and monitor cell calls. This way, the cell users get all worked up and start scraming that a law should be passed to prevent this!! Here we go again...

|> Rob Robinette

Intentionally or not, the ability to make many mods to the PRO-2004/2005/2006
have made them a 'cult scanner'. If these scanners were not easily modified,
I suppose their features would still make them popular, but not as much. If
they were smart, they would intentionally design in dozens of 'hidden'
features which lure buyers into voiding their warantees...

Message-ID: <2ta9op$bb6@gv-gate.gvg.tek.com>
Source record: 273227

I was watching ABC's Nightline last night (Thursday). It was about the invasion of privacy and such. Most of the show was about people using computers to access various data bases to gain information about people. They also showed how people can listen to cell calls.

What was interesting was the fellow's cellphone monitoring setup. He had a program on his pc that was connected to an Icom receiver and probably some data/modem box that was able to decode the cell control information and use that to control to Icom to follow the cellphone handoff to another frequency. It was also displaying other data related to the cellphone on the pc's screen. There was an AEA PK-232 and some other equipment all stacked together. They mention that the program on the pc was downloaded from a BBS. Is anyone familiar with what that setup was and how it all works?

Part 2 of this story is on tonight, check your local listings for time and channel.

Inquiring minds need to know,

4876. NJ State Police Trunked System

Newsgroup: rec.radio.scanner
Date: 1994-06-10 18:10:21 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <2taaad$bd2@nntpd.lkg.dec.com>
Source record: 273228

I haven't listened to this system in a while, but did the other day. Used be there was a logical order to the assignment of frequencies (I believe each part of the state had five frequencies, one of which was for trunking data - and this channel moved occasionally.)

Now it is much more confusing. Is there rhyme or reason to it, or is it intended to confuse listeners?

Thanks!

/ljj

>characteristics like selectivity. Is there any truth to this
>(specifically with respect to the R100)?

I think this scanner is not that popular because of its price/features ratio. The specs on this unit are great, but HF coverage without SSB is of limited interest to many. So we are really left with a VHF/UHF scanner. But the R100 isn't much of a scanner, its more of a comm receiver. Programming is typical Icom - lots of button pushing for simple operations. If I remember correctly there are no "banks" of channels, which is standard now for scanners. If you want a small comm receiver, that can scan in a pinch, then this unit is great. But most people opt to spend more and get the "He-Man" R7100. I have been tempted to get one several times, but I just don't know what I would use it for. Listening to satellites while mobile?

>Radio Shack employees are REQUIRED to maintain a percentage of 80% or
>higher names and addresses on tickets. Failure to maintain that number
>could result in termination.

Yesterday evening I was in a Radio Shack when a new employee was being trained on how to use their Point of sale system to ring up customers.

The manager explained that he should enter the name and address whenever possible. She said that if it was a cash only sale and the customer refused then it was OK to back down. She said that if he refused and it was a being paid for by check, then he could pretty much copy down the info from the check and drivers license. Finally, if it were a credit card purchase then they were to 'strongly encourage' the customer for their name for their protection.

She didn't mention anything about a quota though it could have been because I was at the counter waiting while this employee was being trained.

As long as they've been using this system I've always been amazed that they don't share the information between stores. I shop at 3 different RS stores in this city.

I would like to know this also....monitoring cellular is easy, but he
looked like he had hundreds of dollars of equipment there, not just a
simple scanner.

It sounded like he was picking up the digital part of the initiation (the
esn maybe?)
It was neat..he could track one person's esn...I wanna know how he did this.

|>
|> Now it is much more confusing. Is there rhyme or reason to it,
|> or is it intended to confuse listeners?

I don't know how long a while is, but each time I turn it
on, the rhyme and reason are still there. Troop B in the
north uses the 860-856.4625 and .9625 series, with the
calls progressing backwards by 1MHz being handed off to the
highest entry of the opposite channel set when the lowest is
reached. Troop C is similar with 860-856.2125 and .7125, but
867.7125 replaces 856.7125 (if not, then the 856.2125 is
replaced). I'm not too sure about Troop A as I never get
down that far to pick up stuff anymore. Buses and trunked
telephone calls also appear on a couple of channels in there.

Northstar uses Troop B when not on scene, and occasionally
uses Middlesex County's JEMS1, 155.220 for patient status
reports to RWJUH in New Brunswick.

What's nice is that the Parkway units can be found on
154.905, 155.505, and their input is 158.970. The turnpike
units are on 155.580 (which also happens to be the base
freq for PASP out of Trevose for Lower Bucks County, PA-makes
for a nice handoff from state to state) So, basically you're
left with Routes 78, 80, and a few local routes for the
trunked system. I hardly have a need for it anymore unless
a local agency calls in a bird.

On the other hand, I've had an Alinco 2m/440 mobile in the car for close to a
year now, with zero problems. Nice radio, $150 cheaper than the snob appeal
brands. Oh, I should say, the mike clip thingy fell off the back of the mike. I
put a lock washer on it.

There is a place in Canada that sells such a device for $300 or so
dollars, it requires a computer controller scanner as well.
He has advertise to this group a couple of times in the past.

4894. ICOM R1 RF overload solution

Newsgroup: rec.radio.scanner
Date: 1994-06-10 22:14:52 UTC
From: csdfg@selway.umt.edu
Message-ID: <1994Jun10.221452.3581@selway.umt.edu>
Source record: 273240

I live in a high RF part of town and have had problems with my R1 stopping its scan on frequencies where there is no active transmission occurring. I think this is due to the fact that the R1 is very sensitive but poorly IF-filtered. So it overloads easily and there are loads of images. I tried cutting a one-inch length off of a paper clip and wrapping a thin layer of plastic tape around one end of the clip. I inserted the taped end into the BNC connector on the R1. Voila! A capacitively-coupled antenna that works well to attenuate those strong local signals without an expensive filter mod inside an already fully-packed case. Now, my R1 seems to work almost as well as the R7100 with the difference that I miss the somewhat weaker signals from the outlying areas and some portable units. Since I'm mostly interested in the stronger local stuff while I'm in the car anyway, that's OK with me. This solution to the "R1 problem" may be well known to the monitoring community and maybe what I'm saying is tired advice, but it is new to me and really does the trick. I now have renewed faith in my purchase of the R1.

>again...

heh.. yeah, that's the way life works though.
I just didn't know there was a way to track the esn (the short burst
right before you change cells)...

I wonder if something like this is available for the RS pro-2006?
It would probably be some program that works with the computer interface
for the rs scanners (can't remember the name)

I'd love something that did this with my sound card (put the line out
from the scanner into the soundcard..run the program, and it will tell
you which freq. to go to) -- of course I doubt this is possible since I
presume it to be digital information which is easiy corrupted by noise.

something for all you programmers to think about.

4897. Icom R100

Newsgroup: rec.radio.scanner
Date: 1994-06-10 23:25:16 UTC
From: adam@panix.com
Message-ID: <2tasos$36i@panix.com>
Source record: 273242
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.scanner

Earlier this week I posted the following to rec.radio.scanner and rec.radio.amateur.equipment:

I have a friend who is interested in the Icom R100. If you have experience with this radio, he'd appreciate hearing your comments (both pro and con) as well as alternative suggestions. Pointers to anyplace where discussions about the R100 might be archived would also be useful. I'll forward replies.

Well, either nobody feels very strongly about this radio, or all of you R100 owners (or former owners) assumed that somebody else would answer. The only substantive reply I got was from Richard Crisp. (Thank you Richard).

So this is a second attempt. I'll also add that I seem to remember that there was a series of several Icom wideband receivers (possibly including the R1 and the R100) which were not too well received (no pun intended). I recall hearing about problems with important characteristics like selectivity. Is there any truth to this (specifically with respect to the R100)?

A wall-wart is an AC-DC converter that plugs into a wall outlet, like a
"wart" on the wall. For more info, visit your local Radio Shack store.

the box is called DDI. The company that makes it is called CCS and is in Milwaukee Wisconsin. Mark is the guy to talk to. His telephone number is 414 781 2794 x22 or 24 I think.

The current unit (as of dec 93) has the ability to decode DTMF tones too He can also put the unit in a mode where it will only follow targeted numbers too.

It will also monitor and decode *some* of the reverse channel traffic(the cell phone to base path). He specifically has prevented it from decoding the ESN stuff to keep you from committing fraud. This keeps the cell phone industry association from dragging him into court for aiding and abetting commision of felony fraud. His best customers come from the cell phone industry and law enforcement, so he wants to keep them happy. At least this is what he told me.

>tempted to get one several times, but I just don't know what I would use it
>for. Listening to satellites while mobile?

I agree with what Brent said. I own two of them. I find they are lacking for mobile use because they do not have a high powered audio amp which is necessary to overcome the high ambient noise environment of a moving car.

I use mine for satellite work at home and also for scanning a limited number of police freqs. I have no complaints regarding the performance of the unit. I do wish they would have programmed the unit a bit differently to make it a bit friendlier to use. But they work very well as a comm receiver. They work OK as a scanner.

In a pinch they will do OK on shortwave, but have no SSB and if you decide to mod it to add SSB, be advised that you need to provide some means to tune it to a finer resolution than 1KHz (pull the local oscillator a bit?) in order to get acceptable results (remember that maritime stations can be on 0.5KHz boundaries).

Another quirk is the lack of a line level output (useful for taping or RTTY, not that RTTY matters since there is no BFO!).

But it is a good comm receiver for sure.

SR>

Hi, Susan...
I have had this happen on occasion with my scanners as well. I will be
listnening to an FM radio station. My scanner will then pick up the
leakage from the FM radio.

JW>

What you describe is typicall of cellular systems. I have heard a couple of explanations. I believe it is done deliberately because the cellular companies know that calls can be monitored. So, the landline portion is the only thing received. In some cases, some systems still echo the carphone side of the conversation.

The other one I heard was that it depends on how far away I am from a cell, though this doesn't make sense.

Jerry

4912. Am I ham licensed?

Newsgroup: rec.radio.scanner

While in college I was on the radio and was issued an FCC Restricted Radiotelephone Operator Permit, Form 753-Part 2. It has a grant date of Feb 12 1988. It states I am authorized to operate any radio station which may be operated by a person holding this class of license (per paragraphs 3454 and 3945 of the Radio Regulations, Geneva 1979).

Does this equate to a certain ham license/capability to broadcast? I bought an Alinco DJ-580T a while back and have refrained from using it until I find out. Could anyone with info on how to pursue/convert to a ham license help me out. Thank You, Hawley.

I thought I remembered reading a while back a post regarding NoVa scanning as now being illegal (or frowned upon by officials) in a vehicle. I do not recall if this was validated or not. Also does this apply to those who are ham licensed. I currently hold a FCC Restricted Radiotelephone Operator Permit and wish to know if this authorizes me for any ham/scanning permission in this area. Thanks, Hawley.

Well, from what I've heard, the 205xlt is almost the same thing as the
200xlt, and the light mod for the 200 xlt is pretty simple.

Here's from a e-mail msg about how to turn on the 200xlt. Your mileage
may vary on the 205xlt: anyone who's willing to try should post results
for others interested.

Sherrod

(Begin included text)
Okay, on the CPU (UC-1147), number one is the first pin to the right of the
notch. Number 64 is to the left of the notch. (ie, they go
counter-clockwise.)

To turn the light on, jump the transistor input that is fed by pin 63 (2nd
from the bottom on the left edge--notch to the lower right) to VCC. Pin 26
is VCC and you should be able to trace it to a clear pad near the bottom
edge of the board (when you can read the text on the CPU). This pad is the
alternate location for a jumper chip that should change the low band form
29-54 to 66-88mhz. (Note, I don't know if all the inductors and
adjustments are the same in the European version which employs this
configuration.) Well, about those light pins--pins 60-62 are also VCC.
So if you want the light on all the time, just tie 63 to the pin or pins
above it. You can do this with one find strand of a braided wire and no
soldering if you're carely. But your light will be on whenever the power
is on. If you want to add a switch, solder the leads--one to that VCC
jumper block pad I mentioned, and the other to the transistor that pin 63
leads to. I don't recommend soldering directly to the CPU--it's more
likely to be heat sensitive and those pins are pretty small.

I hope I haven't confused you. Any more questions, just ask!

Brett
--
brett@surfpix.princeton.edu Brett Borowski

(End included text)

PS: if you do this, I would now advise from experience to use a switch instead of hard-wiring it on full-time. Reason: when you disconnect the battery pack from the bottom of the scanner or otherwise remove power from the input terminals to the scanner unit itself with the light turned on with the jumper or switch, you are almost guaranteed to affect your channel memories. It usually would either lock out all the channels, or the reverse, unlock everything, including any 000.000 frequencies (which just add aditional time to the scan cycle). When all the channels are locked out, you can manually unlock them all (a pain for 200 channels), but when they are all unlocked (including the 000.000), you cannot lock out the 000.000 freqs, thus adding extra time to the cycle. Again, your mileage may vary, but this is how it worked (works) on my 200xlt-equivalent (heavily modded 100XLT).

A Restricted RT Operators permit is NOT a ham license. If you want
you use the ham bands, you must get a ham license, and there is no
conversion from what you have.

I just bought a Realistic Pro-2026 scanner from Radio Shack yesterday.
The unit supports 800 MHz, but a majority of the cellular band is blocked
out. (ie 868.9375-896.1125 are blocked). The back of the scanner shows
the scanner is capable of receiving the complete 800 MHz range right
thrugh the afore-mentioned frequencies. Can somebody tell me how to
modify the scanner to uncripple it. (Not that I would be listening to
any cellular phone conversations or anything. Heavens no. That's
illegal. :))

Your help would be greatly appreciated!

I'm interested in the Uniden Sportcat SC150Y/B.

Has anyone had any experience or information about this scanner?

From the advertisement I read, I know it has 12 bands, 100 channels, and covers 29-956 Mhz. It sells for $200 at the store where I've seen it.

Is this a good price for this scanner or should I look for another scanner for around the same price? This will be my first scanner.

Thanks for any help.

Chris (I'm using my sister's account.)

Have you guys ever thought of scanning the normal stadium/arena frequencies?

That works most of the time. It's not like the players are wearing wireless headsets. I would scan local police, fire, and the stadium freqs.

Stadiums usually have security, usher, etc. freqs..

Coincidentally, I just bought one yesterday also...I too am interested
in the mods...please post.

Also, does anyone have a review of this scanner (pro-2026). I imagine
it's similar to the pro-46, which I already own and am very pleased with.
(I don't think having a mobile and a hand-held is too excessive???)

You are absolutely correct that monitoring cellular is illegal.

With that out of the way, here is the PRO-2026 cell mod:

Remove the bottom cover (4 screws).

With the front of the radio facing you and the bottom side up, the lower right corner will have a smaller circuit board with a jumper wire labeled 'L201'.

Cut L201 to restore cellular with the correct 30 Khz steps (how thoughtful of the designers!).

Replace the cover.

No. Part 97 of the FCC regulations (Amateur Radio Service) requires
either a valid FCC issued amateur license, FCC issued reciprocal permit
(issued to persons posessing a valid amateur license in another country
with a reciprocal operating agreement with the US, or a valid Canadian
amateur license.

No. You're not authorized to operate your HT, but it should be very easy for you to get a no-code Technician license, which is all you need. Two basic theory exams (knowledge of amateur band frequencies, Ohm's law, simple ideas of radio propagation) are all it takes. The exams are given frequently (in the New England area, there are 41 exams scheduled for the month of June). Call the ARRL at 800-32-NEW HAM (800-326-3942) for answers to any questions you might have. Do it sooner rather than later. The current waiting period for a new license is 12 weeks. A trip to your local Radio Shack will get you a book containing the question pool for the no-code tech exam.

Good luck!

After years of scanning, I just now noticed a small 4 MHz segment that doesn't seem to be allocated to anything. It's the space between the end of TV channel 13, and the start of the 220-MHz-ACSB-stolen-from-the-ham-community band. My scanner won't cover this range, and I'm curious what's there- Astronomy dead zone? SS/FBI/CIA stuff? UFO chatter? :)
I can't seem to find any data on this 4MHz nugget.

All the VIA radio conversations take place on CN Channel 1: 161:415. If
you are talking about on the road, you need the following:
CN Channel 2: 161.205
CN Channel 3: 160.935
CN Channel 8: 161.025 to hear the CN dispatchers
(now Rail Traffic Controllers)
plus on the Brockville - Smiths Falls leg on CP, you need
CP Channel 7: 161.535 (end-to-end)
CP Channel 8: 160.425 (RTC)

Haruteq lists 418.0500 as VIA Station services here in Ottawa, but I have
never tried to listen to it - if anything it would be station staff. All
train-related converstations are on CN 1.

Let me know if you need any further information, let me know. Have you
purchased (or considered purchasing) our CANADIAN TRACKSIDE GUIDE? It has
all the radio information you need on all Canadian Railways, and MUCH more.

I have no problems using the speaker out jack and using a "line level to
recorder level" attenuator to record with my boom box.

To avoid the problems of switching between speaker and recorder, I have
put the two together so I can record and listen on my speaker at the
same time (or record and turn off my speaker with a switch)

>ham-community band. My scanner won't cover this range, and I'm curious

Hi BJRL:
Along the Mississippi, Ohio and Maybe the Illinois River is a full duples
duplex telephone system - the Inland Waterway Systam. 219 MHz from boats,
217 from land stations, but full duples, so you can hear both sides. This
is a very localized usage. FCC has revently started proceedings for IVDS
(I think that's right), it is a TV Set-top interactive Video device which
Xmits in this region, and allows you to "order a puizza while watching the
Pizza Hut Commercial", etc. Watch for it in the next few years. There is also
a proposal mking its way to the FCC for a national traffic handling system
of Hams on discrete frequencies at 219 MHz at 56 K bps, needs FCC action.
My RS-2005 does cover it, and I hear the Inland Waterway signal when I am
near the Rivers above. Has a control signal that is distinctive, unlike
other control sigs you hear on other bands.
Wieredest thing I have seen in this band is a station licensed to the
Univ of Mo (where I live) at a small no-where burg on 219 MHz with
a Business (IB) designation, just cannot figure it out!
Have fun!

Hello Chris,
I am really surpised to see soo many messages inquiring on this little scanner! Especially considering it is so new. I purchased mine today at WalMart for 199.73 and so far I think its great! The sensitivity is as good as any scanner I have ever owned (right up into 800mhz)) . Just FYI, the Cellular Range has been disabled bu
t I m sure it wont be long before a modification is listed to restore that range of freq's. I seen one comment here on the rec.scanner group that said that it resembles all most exactly the BC200XLT minus 100 channels. If this is so, the mod for the BC
200XLT may apply to the SC150. I think I am going to pop the cover on mine and see if it uses the same , almost standard uniden chip in it!!! Also, the advertisement states 29-956 MHZ, BEWARE that this is not CONTIUOUS COVERAGE in that rang
e of FREQs but rather selected portions of .....ect. Anyway, give it a try, it seems a nice little scanner, the size of it is excellent as well as the weight. 1 year warranty but as we all know Walmart is very liberal about those sorts of things...Rec
hargeable battery and AC adapter/Charger included and a small book of SPORTS freqs, Races, Boats, Museums, Fairs ectect.

I've noticed some comments regarding a battery problem with the 2500XLT in previous threads...but am hoping for a fuller reply.

I've noticed the battery packs on my 2500XLT seem to last sufficiently, but if I leave a charged pack on the set for 4-5 days without using the set, the pack will be dead. I can't believe there would be that much of a drain on the batteries? Any help or comments appreciated.

Hi Brett!
Caught you message and seems to me you have an inside track to Uniden.
I have had a problem with my BC200xlt handheld scanner; you mentioning
the "shake out" period grabbed me a I thought you may of heard of or
could confirm this problem.

Whenever I plug my radio in to recharge, my memory gets zapped! I've
tried many different ways to do this but each time I lose the contents
of all 200 channels! This is a real hassle! I like this radio but
having to reprogram it every time I recharge it is a real pain.

Can you help?

Your reply will be appreciated.

Mike Martin - Tulsa.

FOR SALE:

UHF receive downconverter: Use with amateur 2-meter scanning radio, handy-talkie,etc.

This neat little converter allows you to scan 460 - 464 and 480 - 484 MHz public service bands on any radio that can scan from 144 - 148 MHz. The converter was made by MC Squared Engineering and is the model HC-U2 with a new AAA battery. It mounts on the BNC connector on top of the handy talkie and has a female BNC antenna on top that connects to an external antenna or rubber duckie. Its like new and works perfectly. Price $35.00 + ups.

4950. Sporadic E Opening to New England

Newsgroup: rec.radio.scanner
Date: 1994-06-12 14:21:20 UTC
From: jkearman@arrl.org
Message-ID: <1994Jun12.142120.18276@arrl.org>
Source record: 273144

Late in the afternoon of Saturday, June 11, there was a good sporadic-E opening into southern New England. Based on the states of origin of license plates being run by the police departments I heard, I'm pretty sure I was picking up West Virginia, Tennessee and Kansas. It's possible I was hearing Colorado as well.

The stuff I heard was on some of the frequencies used by the Connecticut State Police, who were somewhat inconvenienced by the opening! These frequencies lie between 42 and 45 MHz.

Sporadic E propagation doesn't seem to be dependent on solar activity, as does traditional ionospheric propagation. Small, densely ionized clouds form in the E region of the ionosphere, and drift generally eastward (in the Northern Hemisphere; the article in Monitoring Times last year got the direction wrong).

Formation of sporadic-E clouds sometimes correlates with areas of large thunderstorms and tornadoes, leading to speculation that wind shear in the upper atmosphere plays a role.

Because the clouds are small, if you used a beam antenna, you'd have to point it at the cloud, which may not lie on a great circle between you and the station you're hearing. As the cloud drifts, one area will drop out and another will pop up. Depending on how quickly the cloud is moving and how large it is, there may not be time for an identification before propagation is lost. Another cloud following the first may bring back the signal, so don't lose hope! It would help to have a few dozen scanners going at once on different freqs, though.

Sporadic-E openings often affect low-band VHF. The openings are common from spring to fall, but may occur at any time in the year. Strong openings may also affect high-band VHF (150-174 MHz). If the low-band (30-50 MHz) signals are thick, try scanning the high-band.

If you still have a TV antenna, have a look at channels 2-13, and the FM broadcast band, too.

During periods of high solar activity, such as occurred from 1989-1992, F-region ionospheric propagation often allows you to hear low-band VHF signals from all over the world. While it's possible for cloud-to-cloud sporadic-E propagation to allow longer paths, it's unlikely you'll hear stations further

than about 1500 miles away.

Good listening.

Jim

I find it annoying to use the speaker out line for recording
because I do not like the volume control on the radio to affect the
recorded level. Usually line out levels are fixed to allow recording
to be unaffected by volume control changes.

From: dongil@netcom.com
Message-ID: <dongilCrAK4o.Eo3@netcom.com>
Source record: 273201

I have had a BC100xlt for 2 years. I am not a scanner tech-head, so
am not sure if the guts are the same.

While they, 100/200, are older models the performance on my 100 is
great. I am a RR nut and stay in the 160.500 - 161.500 range most
of the time. Key features that I like:
10 Priority channels, one on each bank
Fast scan rate
No internal noise problems
Quick battery change
Long battery life, I did 12 hours continuous scanning yesterday.
Have never lost the programming! I have, several times, forgot
to turn the unit off. Has been dead for as long as 48
hours.
Good performance in the band I use.

I got mine mail order from a outfit that pushes older, re-manufactured
and excess inventory items. It was a good buy @ $170 new.

If you want good, basic performance and not bleeding edge stick with
proven technology.

Regards,

Don G

4953. where can I get an 800khz oscillator? (double 200XLT clock)

Newsgroup: rec.radio.scanner

Hello!

I need some advice...

I currently have ~$500 of spending money with which I'd like to purchase an HT. Considering that I don't have a scanner yet, either, and the fact that scanners which can receive cellular frequencies are dwindling fast, I'd like to pick up a transciever with a scanner built-in. (Not to listen to cellular, mind you. I would _never_ do that...)

I had been planning to purchase an Icom 2SRA, but was recently told that the Yeasu FT-530 also covers many of the same frequencies, with a keyboard mod. Considering that they are comparably priced, but that the 530 is a dual-bander, it sounds like a much better deal to me.

A few questions:

Exactly what is the mod for the 530, and which frequencies can be received? Is the sensitivity as good as the 2SRA? Can it receive WFM signals, as well?

I live in south-suburban Chicago... Is the 440 band really _that_ important? i.e. what does the 440 band have that 2M doesn't?

I've been told that Icom's are very difficult to use... Is this really the case? Is the Yeasu much easier to use?

Where should I purchase ham equipment from? I can't seem to find a dealer in the area, so am planning on purchasing it from AES. Has anyone had any problems with them?

Any other advice would be greatly appreciated...

Tnx.

Most, if not all, of the state exemptions make no mention of equipment,
that is, they exempt hams without reqard to any type of equipment.

The issue of ham equipment versus a scanner has risen because the
recent FCC exemption of such laws specifically
mentions ham transceivers. That would only be an issue if a
particular law didn't exempt hams outright in the first place
and you were then relying on the FCC preemption for protection.

: in the area, so am planning on purchasing it from AES. Has anyone had any
: problems with them?

Consider Erickson (sp) Electronics in Chicago. I have no personal
experience with them, but if you want to buy local...

I wish I had gotten a dual bander with some wide-band rx instead of the
2SRA. Don't get a radio for the cellular capability-- myself and most of
the people to whom I've spoken who've listened to cellular have found
ourselves BORED after a week of it. Find someone with a radio that can
scan it and see if listening is exciting for you. Most calls are,
"Honey? I'm on the way home... I'll be home in 10 minutes." That is
IF the cell doesn't change mid-conversation.

Looking to buy a base scanneraaa
wandering if I should get a pro2032 or 2026. Not big into scanners but
I do have a AR1500 which I don't like. Don't want to spend more than the
$220 that the 2032 is selling for now... Suggestions?

Yes, I know the 2026 is a mobile scanner, but heck if it's only $150 I
can certainly use it at home if I need to...

Also, is the 2032 cellular modifiable? Not a big concern, but I have not seen
any mods for it...

It'll never happen. I've noticed some Honda's even have 2 lighter
sockets fitted now, one with the lighter in it, the other with a lid -
specifically there for plugging in accessories.
The lighter may go some day, but the socket won't.

The ft-530 will recieve from 136-174 and 400-512Mhz. It will work in the
800-960Mhz band but it takes about -80dbm to open the squelch, its close
to -120dbm for the ham bands. When modified it will transmit from
136-174 and from 400-470Mhz. I've checked mine for spurious on a hp
spectrum analyzer when transmitting and found it to be cleaner than a virgin.

The only thing to be wary of is using an external antenna near a
pagin/repeater site - its no worse than any other dualbander for intermod.

Then you won't care that the 530 has only 12.5kHz steps in the cellular range, nor that my Standard C558A outperforms my PRO-43 when I've done antenna testing in that range. (The Standard has 10kHz steps. The ICOM W21AT has 30kHz steps, but I've read that it's not very sensitive outside the ham bands. I have no hands on experience to verify this.)

mods can be found in pub/hamradio/mods/yaesu at oak.oakland.edu. I believe this mod involves removing a diode.

I don't know the answer to this, but it's good to ask. HT's, as a rule, do not have WFM. One exception is the 2SRA with its 2 antennae. I'm told that the WFM antenna is attached with an earphone type of plug and is not terribly secure.

>

I don't know Chicago. If it's like other populated areas, the answer may be
room for simplex operation after you've established contact on the repeater.

I have the 530 which I have done the mod on. The receive is 110-180,
300-500, and 800-900 narrow FM and AM. It is transmit capable on all of
the listed except 800-900. Its performance is at least comparable if not
better to my Realistic and Icom scanners. I would highly recommend it to you.

Since you didn't specify what was more confusing about it I can only guess
what could have happened. First, they could be much busier than before.
A busy system will select a channel that isn't in use, and since there
could be 4 conversations going on at once, you cannot know which freq will
be used next. Secondly, they could have reduced their hang time - the time
after a call where the channel stays keyed just in case someone wants to
respond immediately. If the administrator made that time really short,
calls
will end up hopping all over the place. If that timer is longer, the call
will generally stay on the same channel for awhile.

The known UNIDEN problem was that if you left a fully charged pack on the
radio, even while the radio was off, the battery would discharge in a few
days (some report a few hours).

Your problem is probably a reversed cell in the pack or possibly dendrites.
The simple way is to get a new pack. Otherwise you'll have to find the
offending cell and order a replacement (from a Cadnica distributor).

This is correct. The early models had this problem. Uniden will repair it for free during the waranty period. I still need to send mine in. As a consolation, they provide a 2nd battery pack for free.

I have decided to sell my Yupiteru MVT 7100 which I purchased from Javiation last April (my wife hates it too much, so it appears that scanning can't be one of my hobbies :( ). It has been used for under three months and is in good condition. I have the packaging and can send the scanner with all of its original accessories (antenna, rechargeable batteries, 12V power adaptor, car adaptor, and earphone).

I will also send the nice instruction booklet that Javiation sent with it.

If you are interested, please make an offer.

I was just relaying the info.

I have heard of this problem on early 200XLTs. I'm sure Uniden is aware of it. Because of the time passed, I doubt if they will repair it for free, but you could ask them. I looked through my Uniden mods list and can't find a fix. Maybe someone out there might be able to help you out.

I just got off the phone with Uniden (1-800-297-1023) and they told me to send in my BC2500xlt for a battery "enhancement". This mod is supposed to fix the battery going dead if left unplugged, and short battery life. My BC2500xlt did not have short battery life, the battery just refuses to hold a charge after scanning for six hours. If you have done any "mods" of your own be warned that the unit will come back with factory specs!

Sorry, I have such a boring question, but can someone please
tell me whether the outside surface of the barrel connector for
the 12VDC supply is positive or negative (the inside surface
will of course be the opposite)? I want to make sure I have the
polarity correct before I connect the scanner to a 12VDC source.

Thanks,

John

P.S. The radio I'm refering to is the Uniden BC890XLT.

Yes, I have noticed this also. I'm not sure exactly why but I think it is
realted to the fact that the little data chirp you hear, tells the phone to go
to full power just before the handoff. It may tell the phone to do more than
that but I'm not sure. Maybe Bill Fisher can fill us in on the details.

Jim,
I too have wondered about this same phenomenon here in the Chicago area. Although I have not listened to much cellular traffic, I can clearly remember having both sides of the conversation clear. Lately however, our "A" carrier here has suppressed one side of the conversation somehow. I really don't know what has happened and am curious as to the reason. I have not experienced the same difficulty with our other cellular provider here. So.. it seems that it is not a problem with the scanner. I am using a PRO 2005. I am very curious to see if there is an answer to this out there somewhere. Let me know what you hear.
Alan.

From: jmaikin@flash.LakeheadU.Ca
Message-ID: <2155@thunder.LakeheadU.Ca>
Source record: 273143

I bought a Pro-43 last week. They were on sale at Rat Shack, and I couldn't resist. Anyways, I need to pick up a frequency at 27.95 and the Pro-43 only goes down to 30. So what do I do? Get a new scanner? Or is there a mod out there for this.

Its one of the frequencys used by the campus security. We have a repeater on campus. I can hear one side of the conversation at 462, but I can't get the hand-held units broadcasts. I have a book that lists the frequencys for the province. It says that there are 4 channels here at the school. And there is only activity one one of them. And the last one at 27.950 I can't pick up. Can you broadcast on 462 and 27 with the same antenna? I'm trying to figure this whole thing out.

Help is muchly appreciated.

J.

Hello,

My trusty old PRO-2004 died in its sleep over the weekend. I am
checking into having it repaired, but I have pretty much decided to replace
it either way. What advice can owners of the BC8500XLT offer regarding
that scanner? I've heard of the intermod problems, but I will be using it
as a base scanner in a small community about 5 miles from Sioux Falls hooked
to a RS discone antenna. It this scanner worthwhile, even though the
cellular is unrestorable? Anyone have availability/feature information
regarding the new 1000 channel Radio Shack scanner? Thanks...

It is positive pin, negative ground, just like your car or truck. Actually, if you look at the power pak, on the back, you will see a little graphic which I cannot reproduce here. It is found just under the statement, "Output DC 13.8V 700 mA."

It shows the outside negative and the inside positive.

Good luck with the 890, it's a good rig.

BDH> charge. Uniden diavows any knowledge! Thanks!

Hi, Ben...
You got 6 hours?! I have only been able to get 5 max out of the two
packs I have.

Basically, the early production of 2500's had a problem with the
battery discharging while the unit was off. If not used for 2 or 3 days,
the battery would be dead. Apparently, too much current was being used to
keep the memory alive. Units purchased after December of '93 should have
the battery mod in place. If you aren't hesistant about opening your unit,
go ahead and do so. If you see 2 white wires being run on the inside of
the unit, then the battery mod has been performed.

As to why your pack won't charge...is the red light on the pack
lighting up? If it is not, then the pack or the adapter is defective.

Will it power up with the adapter plug in the unit?

Jerry

Bob...
Some early production units did have a problem with the batteries dying out after 2 or 3 days and the unit off. Units purchased after Dec of '93 _should_ have the mod performed. If you are not sure, you can open up the unit and see if 2 white wires are being run through the unit. If they are, then the mod has been performed.

If you bought before December of '93, then the unit will definetely need to be modified. Send back to the address on the back cover of the owners manual, along with copy of receipt. Don't forget to ask for the second battery pack, which will be provided free.

JAS>
JAS> Also, is the 2032 cellular modifiable? Not a big concern, but I have
JAS> not seen any mods for it...

Product...Realistic PRO-2032 by Radio Shack
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape
may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.

6. If successful, unplug the unit and reassemble the scanner.

I am new to scanners and I wonder where to find the 10 and 20 codes that the police use. Also what are codes 1-4?

Thanks in advance for any replies,

John Spencer jrs@fc.hp.com

5006. PRO36 Questions / Mods ?

Newsgroup: rec.radio.scanner
Date: 1994-06-14 02:42:23 UTC
From: cps@access.digex.net
Message-ID: <2tj5ef$3iu@access3.digex.net>
Source record: 273154
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I just purchased a used PRO-36, and have some questions. The scanner didn't come with a manual. I've been able to figure most things out, except for searching. I can't do anything except get it to search either up or down from a frequency - I can't get it to search BETWEEN two limits.

Also, are there any mods for this scanner? Extra channels, faster scanning, expanded freqeuncy coverage, etc?

If someone could point to me an ftp site with mods for the PRO36, that would be appreciated also.

Thanks,

Chris

5007. AOR 900 PRIORITY GLITCH?

Newsgroup: rec.radio.scanner
Date: 1994-06-14 03:31:05 UTC
From: hodo_gary@macmail2.cig.mot.com
Message-ID: <hodo_gary-130694213105@mac-aj-4.cig.mot.com>
Source record: 273161

I have owned an AOR 900 handheld scanner for about 4 years now. It is a fairly reliable scanner with excellent sensitivity. The only problem I have encountered is that when the priority function is toggled on, the scanner will sample that priority channel every 6 seconds. As with most other scanners, the sampling rate is between 2 and 3 seconds. I have two friends who also have AOR 900 handhelds and experience the same problem. Is the sample rate written into the CPU or is there an internal adjustment that can be made to speed up the sample rate? Possiblly a resistor change? Ace Communications was not very helpful when I inquired. They said to send it in to be checked out. Considering my friends have experienced the same thing, I tend to think that there is nothing "wrong" with the unit. Any help with this problem will be greatly appreciated. I am using a friend's computer terminal. Please send to his address and address all Mail to me.

Thanks in Advance,

Dave Panek

Isn't it funny that in 1994, we just do not simply assume that some type of indirect access to FCC frequency records would be provided by the FCC on the Internet?

In any case, some information from the FCC is available. I find the NPRM's and the daily agenda's interesting. Point your gopher client to `gopher.fcc.gov'.

5009. Pro 2006 unused channel L/O

Newsgroup: rec.radio.scanner
Date: 1994-06-14 04:17:30 UTC
From: pthompson@walnut.prs.k12.nj.us
Message-ID: <1994Jun14.001730.931181@walnut.prs.k12.nj.us>
Source record: 273155

I just purchased a Pro 2006 with my eye on adding the Opto 456 board, and have a question about the channel entry method. It appears that all unused channels (0000.000) are scanned unless I specifically lock them out one by one. What am I missing here? I've never had a scanner before where blank channels defualt to being scanned. This slows scanning down considerably!

Also- is there really anything up there above 950 Mhz or so? I hear lots of birdies, but virtually no real activity. Perhaps it is the lack of a good antenna, but I would think I would here something...

Speaking of antennas- why doesn't anyone list gain characteristics for antennas in catalogs? I'm sure they are there somewhere, but I can't find them. I'm looking for an antenna that will give me good reception on the 46 Mhz range where I have various things to listen to, plus the 160s, 460s, and 930s. Obviously these are all going to call for quite different antenna characteristics. I read a lot about Discone antennas being good for wide ranges, but then some are supposed to be better than others. Is there any source for good independant testing of antennas? Is the Channel Master MoniTenna 5094A that the Grove catalog mentions any good, and available anywhere?

And of course I have to find something that will fit in a 45 inch high attic!

: at 27.950 I can't pick up. Can you broadcast on 462 and 27 with the same
: antenna? I'm trying to figure this whole thing out.

You could, but it would be highly ineffective. If one side of the conversation is on 462, then the other is either on the same frequency (simplex) or on a nearby frequency. Try listening 5 and 10 MHz above and below the frequency that you can hear - you may find them there (if they are duplex).

There are several ways to implement this, so without a service manual it's anybody's guess. I would bet that the priority is built into the CPU such that when enabled, the ROM code executes the priority routine. If this were the case, the only way to increase the sampling would be to speed up the CPU so that it executes the code faster. On a more optimistic note, the CPU could be interrupt driven with an external source to generate the interrupt. If this were the case, you could probably do a mod to increase the sampling rate.

If memory serves me correctly (which is questionable), the mod was for the Pro-51 (and 23). The reason it won't work on the SportCat or BC 220XLT, is that they don't have a "direct search" function. The way it works is to load this one cell freq into memory and do a direct search from there. Without the direct search, even if you could get the frequency into memory, you couldn't do anything with it.

Bull. Program the frequency of your favorite repeater into one channel of
your scanner. It is now "amateur equipment."

And the local cop doesn't get to decide if it is or if it isn't. You have
a FEDERAL license for amateur radio equipment, and the FEDERAL rules
pre-empt the state or local rules.

And you don't even have to learn morse code. . . .

I know this is the wrong forum but...
What good is a laser detector?
If the beam is aimed at you, the lock time is so fast that you're dead.
If the beam is not aimed at you, how can your detector detect it? The beam
spread is only inches wide.

This is the sound of a trunked system control channel. The channel hops
around to give the repeaters a rest from continuous transmission. If you are
scanning the system, you just have to lock it out and then unlock the
frequency that used to have the noise on it.

>

My guess is that a D504 diode enables a circuit that prevents certain
bands from being monitored, just like the D502 does. This is because
different countries have different laws as to what frequencies you are
allowed to listen to. Hmm, I might buy a diode, plug it in and check
it out just for fun. :)

Which brings me to this question: I located the 4 spots for the D50x
diodes (top corner behind the keys). But, apart from the top one, D503,
the numbers are covered up by soldering! I can only see "D50", not the
last digit. Which is which...? Picture of the board layout:

D503 o <-- has a diode in it

D50? o <-- is empty

D50? o <-- has a diode in it

D50? o <-- is empty

Thread started by jim@ttech.com (Jim Wayda), Transitional Technology, Inc

>> When monitoring cellular communication in the frequency range of 869mhz to
>> 894mhz there are many instances when I can only hear one of the parties
>> involved in the conversation. In other instances, I can hear both parties
>> involved in the conversation. Can someone please provide information as to
>> why this is happening?.

From my experiance I have found the following. The wireline company's bases
do not rebroadcast the mobile side of the transmission while the non-wireline
company's bases do rebroadcast the mobile transmission.

Here are the frequency allocations:

Wireline cell sites (bases): 880.020 - 889.980 Mhz
Wireline mobiles (car phones): 835.020 - 844.980 Mhz

Non-Wireline cell sites (bases): 870.030 - 879.990 Mhz
Non-Wireline mobiles (car phones): 825.030 - 834.990 Mhz

These frequencies are for a system that is using the 870 to 890 Mhz format.
It is not as clear cut of whos' freq. is who's when you are using a
system in the 869 to 894 Mhz range. (Only the 869 - 870 and 890 - 894 are
different than above.)

I have found this to be incorrect, at least in the Dallas/Ft. Worth area.
Several base channels in both groups broadcast one side of the
conversation only. I'm not sure why unless it has to do with the
specific switch assigned for that channel. I can't recall ever chasing
one of these one-sided calls to another cell frequency to see if it is
still one sided. That would provide some interesting information though.

They are from the Swiss; suprise suprise, the ones that showed up here
in the US operate in the Ka band about 34 Ghz. All the US radar detector
suppliers offer models that cover this band. If you choose to get such
a detector get one of the frequency agile models that sweep the entire
Ka band as there are a lot of hand held units in another part of this band
comming into service. The newest units also offer some form of laser detector
also not a bad idea as this form of harassment is gaining popularity with
traffic police every where. We call our traffic cops tax collectors with
guns, since your cops don't have guns for the most part perhaps just taxman
would be appropriate (with all due apologies to the Beatles) Cheers

Not having the mobile audio repeated back on the base frequency also
results in better vechicular speakerphone operation. It puts some
attenuation in the feedback path.

I think the cell site and the phone are on 45mhz split frequencies. I don't know which is which. If this is the case for all cell systems why would the base site side-tone the callers voice back again on the phones own transmit frequency? (It has to be the same one since I can occasionally hear it full duplex.) I suppose the phones could do signal quality monitoring but I can think of lots better places to do that than in the phone itself. Perhaps there are some legacy systems that are full duplex on a single frequency.

As for the chirp-tone, I thought that signalled the PHONE to switch frequencies to pick up the new base site. The original frequency stays clear for 'a while' so that if the handoff fails the phone is still connected to the handoff code and can thereby try another handoff.

Distilled conjecture.

What P.D. are you looking for? The codes vary from P.D. to P.D., but if you say which P.D. you're looking for, someone may have them and be able to help you. Also, a good source is Police Call (available at your local Radio Shack), which lists the 10-codes of many larger cities in the back.

I have already seen some posts on making a dipole antena, however, I didn't have a scanner at the time so I didn't save any of the articles. I've talked to several people and it doesn't sound too difficult but I don't know what the best length should be, etc.

Thanks for any help!
-Andy

Hello boys and girls!!!

Now you too can have your own genuinely ancient PRO2001 scanner.

Features:
16 channels
Frequency search
two antennas
Runs off from ac or 12 volt dc sources!
LED display
Pretty good sized.

This is actually a pretty good scanner for someone interested in checking
out the hobby.

It covers frequencies from: Shoot. Lost my list.
It will not cover aircraft.

It will not cover cellular/800mhz.

It does cover ~50 megahertz, 100some, and ~450 megahertz. I can
find the specifics if you want them.

This, I believe, is the first non crystal type scanner radio shack
put out.

Interested?

Email or phone call

mm884030@longs.lance.colostate.edu
or (303)444-8151

thanks for your time.

Robert C. Walker mumbled something like:
:-> I've noticed some comments regarding a battery problem with the 2500XLT in
:-> previous threads...but am hoping for a fuller reply.

:-> I've noticed the battery packs on my 2500XLT seem to last sufficiently,
:-> but if I leave a charged pack on the set for 4-5 days without using the
:-> set, the pack will be dead. I can't believe there would be that much of a
:-> drain on the batteries? Any help or comments appreciated.

I've had no problems like you have mentioned with mine. As a matter of
fact, I moved last week, packed the radio, and six days later pulled it
out. It worked for quite some time then before it auto-shutoff for a low
bettery (at least several hours).

There was a tremendous amount of e-skip this past weekend coming in to NYC, particularly noticeable at TV channels 2-4. We were able to copy TV stations from several cities in Louisiana (!), Tampa, FL and, oddly, Illinois!

All this was done on a portable set with a pair of rabbit ears....

Never mind how the PRO-2006 was buzzing! ;)

I received the following letter in the mail, today, and thought that someone here might be able to help him:

I am 25 and recently I became interested in VHF/UHF scanning. My biggest dream is to purchase a handheld programmable scanner. Unfortunately, scanners have not yet appeared in Russia. There is no any opportunity to buy a scanner by mail from Europe or the USA, because I have no hard currancy and it is very difficult to transfer money abroad.

Could you help me? I would be very, very thankful to a person who send me a second-hand operating scanner. In return I will send Russian souveniers. Any hand-held scanner with the automatic search function is o-k. I don't know local active frequencies so the auto-search is a must. Please us registered mail to avoid stealing. My address is:

Nicolai Rudnev
Lenina 5A-34
Stroitel,
Belgarodskay Obl,
309120 Russia

Yours Faithfully,
N. Rudnev

Maybe there is someone here that has an old handheld that they can part with. I do have one, otherwise it would be in the mail. Thanks in advance from Nikolia.

Remeber to lock out all unused banks and then you just have to lock out
those zeroed channels in the one bank you are scanning (pro requires at
least one bank enabled). only have to do 39 lock out operations not 399.

If you can hear both sides, it is because either (1) the cell phone manufacturer added sidetone capabilities so that the customer could hear himself talk - this electrically links the tx and rx path, or (2) the PSTN provides sidetone, and the cellular system simply forwards the PSTN sidetone back over the forward voice channel (from the base station.)

One guy said he could hear the customer just before a handoff... this makes sense, since a handoff occurs under weak signal conditions (by definition) you want to make sure that the link is solid before you send and receive signalling to go to another channel- so it makes sense for the base station to tell the cellphone to increase power just before this dialog.

I stand corrected. This mod works. I was mislead on the newer "A" models
by the fact that the innards were somewhat redesigned and also because there
was no diode to cut. Now, instead of a diode, there's just a wire jumper.
Just another fine example of why you can't trust what the people at Radio
Shack tell you. *sigh*

I was listening to a ham repeater in the 440 MHz range on my
scanner last night when a rude and obscene jerk kept cutting in on
the hams. He did not identify himself, he just shouted and insulted
the people on the repeater. The hams referred to him as a
boot-legger a few times, and then one said "He's using a Radio Shack
hand talkie, and we have the serial number. We know where he lives
and we'll have the police knocking down his door soon now." A
little while later, the same ham said, "We've been able to
triangulate his position, and I'll be making my call about him
shortly".
My question is, were they bluffing just to scare the guy off
of the repeater for the night? Is it possible to get the serial
number off of the ham rig that someone is transmitting from? I've
heard about triangulate someone's position before, but is it
accurate enough for hams to do on their own, like this ham was
talking about? Any info would be great!

Some info on future scanner models...

Subject: #Info on new RS scanners! - Msg Number: 277506
From: Howard Bornstein 76174,637
To: All
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 14-Jun-94 03:59:29

Here is some information gleened tonight from a very reliable source:

There will be three new scanners available from Radio Shack this year.

One is the much-discussed 1000 channel, triple-conversion base scanner, made by GRE. It will be called the PRO-2035. Memory is arranged in ten banks of 100 channels each. Each channel has individual lockout and delay. The PRO-2035 also has 10 search banks.

A PRO-2035 feature, which is new to GRE-made radios, is its auto search/store capability. Using it, you can automatically store active frequencies, found durign a search, into the channels of Bank 1. Unfortunately, this feature doesn't check for duplicates, so you may fill up the bank with the same frequency, especially if it finds an open carrier or something similar.

Coverage is 25 Mhz to 1300 Mhz, minus cellular, which will not be restorable, and minus UHF TV audio. User can switch between AM, FM and wide FM modes and can also set search increments.

The scanner scans and searches at 50 cps. Another new feature to Radio Shack scanners is its VFO tuning knob. In one mode it'll let you move quickly up and down the memory channels while in another mode it'll act as a direct search knob and let you move up or down from a given frequency at a user-selectable step.

Unfortunately, many of the features we have been hoping for on a high-end base scanner from Radio Shack are missing in the PRO-2035. Foremost is the lack of any kind of built-in computer interface. It is baffling in a new, 1000-channel scanner that it doesn't come with some way to connect to a computer. We will probably have to wait for a company like OptoElectronics to design a computer interface.

Secondly, there will be no PL/CTCSS decoding capability and no add-in boards with this capability to be offered by Radio Shack. No signal strength meter or hit counter either.

The unit is, unfortunately, supposed to have a "cheap" feel to it, as RS has apparently tried to cut costs by using cheaper components, such as a flimsier cabinet, a thinner power cord, etc.

Even though the channel capability has been increased, this is a rather disappointing offering from Radio Shack. Two of the most desired features, computer interface and PL decoding, are missing from the unit. It is using the clumsy 100 channel-per-bank memory allocation, unlike the new AR8000. And its features, from auto-store to its speed, are rather dull, particularly compared to current Uniden scanners. It's main strength is that it is a triple-conversion GRE-designed scanner. As a radio, it should be quite good. But in terms of features, Radio Shack is getting clobbered by Uniden.

Radio Shack will also be releasing a triple-conversion handheld, also made by GRE, called the PRO-62. This will fit somewhere between the PRO-51 and the PRO-43. I presume 200 channels, although this wasn't specifically mentioned. However, it will lack the military air band and it will have no direct search capabilities.

The third GRE-made scanner is the PRO-2037, a 200-channel, triple-conversion, base scanner with selectable modes.

I'll post more information as I get it. Thanks to Steve Share who helped me compile this information (no he's not the source, but he's also reliable <G>).

Howard

Subject: #277506-#Info on new RS scanners! - Msg Number: 277519
From: Jeff Goldman 76703,4224
To: Howard Bornstein 76174,637
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 14-Jun-94 05:48:03

Since the Pro62's ready, I wonder if it will be out sooner rather than later. Also, what happened to a "Pro2036"? There's now a Pro2030, 2032, 2034, 2035, and 2037 (including your list). I don't remember if there's a 2033.

You didn't mention alphanumerics for the 2037, but I called Steve Share and he said that it wouldn't have that. And that the BC8500XLT IS DISCONTINUED! The only worse news would be if RS does go ahead and kill off the Pro2006, considering that the price of it and the Pro2035 are probably the same.

Strange that Uniden would kill off the BC8500XLT since it's unmodifiable. Or is it? <g> Also, with its strong images of cellular (in the 1200+MHz range), it sounds like they used similar technology to the BC2500XLT for 800MHz reception. Did we ever ascertain if Lescomm found a resistor to move or whatever to restore cellular?

By the way, as of now, still no AR8000s in the UK.

-Jeff

Subject: #277519-#Info on new RS scanners! - Msg Number: 277670
From: Howard Bornstein 76174,637
To: Jeff Goldman 76703,4224
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 14-Jun-94 15:10:11

Jeff, Unfortunately, it does look like the PRO-2006 will be killed off. Our source thought so and the stores can't get them anymore. That leaves the PRO-2035 as the

sole high-end base model for RS and it's not much of an improvement over the 2006 (in fact, once can argue that it's worse, with its awkward 10 banks of 100 channels).

If AOR got it right this time, and (as it appears) if they are serious about the US market (by making a version that has cellular deleted) then the AR8000 and the AR5000 (base model) may fill a real hole in the US scanner line-up.

Maybe the AR5000 will be enough of a threat to prompt Yupiteru to revive the long-delayed MVT-8100.

Regards, Howard

Subject: #New Uniden scanners! - Msg Number: 277523
From: Steve Share 70242,2472
To: All
Forum: HAMNET Sec: 02-VHF/UHF Scanning
Date: 14-Jun-94 06:20:41

Following up on Howard's report on the new RS/GRE scanners, there is also news of new Uniden models to be introduced next week at the Summer Consumer Electronics Show in Chicago:

BC-60XLT: This is the new low-end Uniden handheld, the key here is low price. It's referred to by Uniden as a "10 band" scanner, it will have 800 mHz (all new Unidens will have it), and possibly aircraft.

BC-80XLT: one up from the bottom, this has 12 bands vs. 10 in the BC-60.

BCT-7: the new Beartracker, will have 100 channel memory, keyboard, and band search. It's a "mobile" sized scanner, between a handheld and a base.

BC-144XL: a new base scanner, 16 bands, and a "more radically modern design".

BC-178XLT: higher-end base scanner, 100 channels, service search.

All new Unidens will have the 800 mHz band, turbo scan, and data skip.

The 8500 is discontinued, and does not (at the moment) have a replacement.

I'll be at CES next week and hopefully will get literature on these to better fill in the picture. With nothing really interesting from Uniden, and the disappointing info on the GRE 1000 channel RS unit, it seems like the AOR 8000 is the only interesting game in town. And no new info as far as availability, as Jeff will agree. There is some news of the AOR 5000, something further off in the future which appears to be a further evolution of the 3000A, rather than an 8000 in a base configuration. Nothing definite at this point, though.

Hello everyone,

I know that this might not be the best group to post this question in, but I figured some of you might be able to help me. I've heard of a device that you can hook up to your telephone line that will tell you the phone number of the last person that called you. Here in Calif. the device is illegal, although Pac Bell will sell you a service called 'CALL RETURN', but it won't tell you the number. The local Radio Shack guy said that Radio Shacks in other states (he didn't specify which states) sell such a device.

Can anyone tell me which states (hopefully one that neighbors CA) sell something like this? Approx. cost? Works with any phone system? Any other details.

Thanks in advance for any help here.
Mike

I agree mostly with what Robert says with one exception. It is possible with some recent new programs combined with a sound card to capture the "audio spectrum signature" of a radio. This might be conclusive enough to determine what type of radio is transmitting the signal (if you had some "signatures" to reference). The part about the serial number, is a bit too much to swallow. The triangulation thing is no big deal, but it usually takes some time (to setup and coordinate). My guess is that it was a bluff. Hams rarely go to so much trouble to track someone down unless the guy was a repeat offender.

When a flight is going on, search through the ham 2 meter band. There are ham clubs that retransmit the audio. Direct reception is beyond the capability of most hobbyists.

No you cannot get the serial number unless you look at the nameplate on
the radio.
Triangulation is old technology. RDF (radio direction finding) as
practiced by Amateur Radio Operators is best done with a `doppler' unit
which can be hand held and points directly toward the transmitting antenna
even it the transmitter is on the air for only a second or so.

Much of what you heard sounds like BS. (Boasting Speech)
But we have found a couple of illegal transmitters here in the middle of
Kansas by just RDFing them and walking up to the source.
One was an ELT (emergency locator transmitter) in some guy's house, and
one (just this week) was a business band handheld radio operated by some
teenagers on the local police frequency (460.025).

Once you get the right equipment, or in the case of the Amateur Radio
Operators around here, build for yourself the right stuff, RDF is actually
quite simple on VHF and UHF.

semi-unconfirmed rumor has it that Optoelectronics is planning an "Interceptor II" that can hear any near field frequency and will have a frequency counter built in with memories. So you can know the frequency of what you are listening to and be able to store it in memory.

To answer your question, there is no equipment that can do what you want right now.

> Any comments or opinions will be gratefully received.

I use a program called 801SCAN for my R7000. I have about 280 different banks of frequencies so I can quickly monitor who I want. I put the cursor over "FBI" or "Highway Accident" or "Wireline cell B input" and hit enter and presto, I'm listening to just the frequencies I want. Much easier than trying to cram it all into 10 banks and pushing lots of buttons.

>to several people and it doesn't sound too difficult but I don't know what
>the best length should be, etc.

It depends on what frequency you want to listen to. For example,
cordless phone base units are around 46.6 to 47 MHz. The formula
for determining length in feet is 468/frequency in MHz. So, 468/46.8
would be 10 feet exactly. Take some Radio Shack speaker cable (cat.
number 42-2478 18-gauge 24 feet brown with RCA plug) and run 19 feet
of it from your scanner up the wall. Cut the phono plug off the other
end and seperate the last five feet of wire so you have it ten feet
apart. Mount it on the wall. I've found that horizontal mounting is
fine but you could mount it sideways too (vertically) since most base
units' antennas are in the vertical position. Get an RCA to BNC adapter
for your scanner antenna jack and you're in business. You'll be amazed!

Message-ID: <1994Jun15.135020.2485@hnrc.tufts.edu>
Source record: 273036

Always looking to expand my horizons, I'd be appreciateive if someone would expound on the wonders of computer controlled scanning. (I've been toying with the idea of getting an OptoScan 456 for my PRO-2006.)

My (mis?)understanding is that the major advantage of computer control is that it simplifies the task of discovering what frequencies are actually in use. I could leave the unit for long periods of unattended scanning and review its finding at my leisure. I can see how this would be useful to do--once. But what use is computer control for the hobbyist after you've already got a good idea of the usual levels of local activity?

Any comments or opinions will be gratefully received.

Thanks.

Source record: 272989
Cross-posted to: rec.railroad,rec.radio.scanner

This posting is addressed to railfans and radio scanners alike who may be familiar with frequencies in southern and central Indiana.

I'm looking for frequencies in use by the Louisville and Indiana Railroad Company. The LIRC is a shortline that started business in mid-March of this year on the ex-Conrail (nee-Pennsyvlania RR) branch that runs from Indianapolis to Jeffersonville. Some of the towns it passes through include Greenwood, Franklin, Columbus, Seymour, and Scottsburg. The short line is owned by Anacostia Pacific. Because it's such a new entity, its frequencies aren't listed in any compendium of railroad frequencies (Police Call and the like). Has anyone had the good fortune of finding out these frequencies? If so, please let me know. Thank you in advance.

Of course, that bootlegger could have been YOU, & now you're
asking about the situation to try & decide if they were bluffing or not,
but oh well..

I'd say they were bluffing. The ones that get on the air &
when a bootlegger is on & start talking about triangulation, FCC, etc.
are usually bluffing. It is the people that you DON'T hear on the air
that are actually taking the time to RDF, and the (probably) old-timers
doing all the talking about triangulation were probably doing a
disservive to anyone out there who was really going to take the time to RDF.

I doubt that the triangulation capabilities of most hams are
accurate enough to give an exact location. Triangulation can point out
the general area, and then you go there & home in using attenuators &
portable directional antennas, & perhaps a filed strength meter once your
at the person's house.

It is possible that the people yakking about triangulation, etc.
DID locate the guy, but that the FCC had more important things to do, so
the hams were semi-bluffing you out of frustration & hopes that it would
scare the person off.

Not to mention FUN! T-hunting is a popular recreational activity for hams. The great thing is that you do not need to be a ham to participate in a T-hunt. We have several non-hams who use hand-held scanners in our local hunts. No special equipment required for a beginner as you can use "body swings" to find bearings with your handheld.

Check it out! Contact your local Ham club to see if they are organizing hunts. If they find out that you are interested, they will virtually drag you out for the hunt!

I have for sale a Radio Shack Pro 43 Scanner. The radio includes the rubber ducky antenna it comes with, the radio shack telescopic antenna and the radio shack antenna extension with suction cup mounts. The radio is in like new condition, comes with the box and manuals and works perfectly. The cellular modification has been performed on the radio. I am selling the radion becuase I am buying a 2m rig and need all my pennys.

Make an offer

Call Denise Tel (800) 423-1331 at Uniden service center and inquire about
battery enhancements, they will request that you send them the scanner and
battery pack, they will fix the problem and if you request an extra battery
pack they will send you one free

A lot of police officers keep a copy in the pocket of there sunvisor. Next time you see a parked police car with its window down just reach in and get one. ------ Just kidding -----------

While most of the codes are standard, there are some differences between some police departments. Also there are more then just 10 code. I went in and asked my local Radio Shack manager and he gave me a photocopy of our local code and frequencies.

Another possibility - perhaps they were goading him into continuing to transmit
while they homed in on him. One of the biggest problems is when they don't
transmit long enough to track them...

Those actually talking to the person on the radio and telling them that he is being triangulated are not always doing those who are doing a real RDF a disservice. Someone has to keep the jerk on the air long enough to locate them. Many of these jerks expect Hams to react by telling how much trouble their in and thats the only way to keep it going long enough to find them. Otherwise they will be back.

Having participated in 'tracking down' many of these type of people I also usually let them know they have been found by either honking or keying up and telling the real Hams on the frequency that I did in fact find the person. That way if the FCC is too busy to follow up right away the scare keeps many of them from returning.

JS>

Hi, John...Codes are a frustrating part of scanning. They vary from state to state. For example, a 10-99 here in Illinois is a wanted subject. 10-99 somewhere else could mean a mental case.

A good source may be to find a scanning club in your area that may have this information. Also, a good ear to the call dispatched may help. If a 10-6 is barking in the back yard causing a 10-37 to occur, it is obvious a dog is disturbing the peace. <g>

PT> scanning down considerably!
You're not missing anything. That is the default on the 2004/5/6. Yes,
it is a pain to lockout all of the zeroed channels. At least on the 2500,
they lock them all out for you and then unlock after a frequency is
programmed.

PT> Also- is there really anything up there above 950 Mhz or so? I hear
PT> lots of birdies, but virtually no real activity. Perhaps it is the

SB>
SB> : regarding the new 1000 channel Radio Shack scanner? Thanks...
SB>
SB> Steven

Steven...
When Uniden was getting ready to ship this unit out, they discovered
alot of problems. One was the presence of too many birdies. Uniden
re-designed the chip. At this point, the Telecommunications law that made
it illegal to manufacture scanners with cellular capability after April
1992 was passed. With this in mind, Uniden re-designed the chip and
decided to get a head start in complying with the Cellular Telecom law.

So that's why no mods have ever been figured out for the 8500 for
cellular reception. It can't be done.

CS> Also, are there any mods for this scanner? Extra channels, faster
CS> scanning, expanded freqeuncy coverage, etc?

Hi, Chris...
I'm sorry I don't know anything about the '36. I can only speculate
that to search, you would have to enter a frequency, then press LIMIT, then
a second frequency, press LIMIT, then SEARCH.

If this unit doesn't have these keys, then tell me what it does have
and I am sure I could point you in the right direction.

To my knowledge, there is no mods for the '36.

TB> experience (mods, etc.) with this model. It was on sale for $229.
TB> thanks.
TB>

I have no experience with the unit, but there is a mod that just came out
for the 2032.

Product...Realistic PRO-2032 by Radio Shack
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape

may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.

Sounds like you are describing a 'trunked' radio control channel. The
control channel usually handles what radio traffic is going to use what
channel in a multi-channel enviroment. (at least 5 channels, typical)

Jerry

5112. New favorite scanner story

Newsgroup: rec.radio.scanner
Date: 1994-06-15 22:48:01 UTC
From: moore@ssd.intel.com
Message-ID: <CrGnC1.CHn@SSD.intel.com>
Source record: 273054
Cross-posted to: rec.radio.scanner,rec.aviation.misc

The other day I was sitting at the local airport (Hillsboro OR)
listening to the local aviation frequencies on my scanner,
eating my lunch, and watching operations at the airport.
One of my favorite lunchtime activities on a sunny day!!!
I heard what has become one of my all-time favorite scanning stories.

I gradually became aware of a faint transmission on one of the
Seattle Center frequencies. It was sort of intermittent and I
wasn't paying a lot of attention at first. When I heard a very
strong transmission of "you are on a Seattle Center frequency. Please
move your conversation to another frequency." I started paying
more attention.

It seemed to be a pilot taking a passenger on his/her first small
plane ride. Apparently the pilot's push-to-talk switch was stuck
on, as I could hear only the pilot, not the passenger. The pilot
was explaining the instruments, controls, etc. Typical first-time
passenger stuff, although not usually broadcast on Center freqency. :)
I kept waiting for the passenger to ask "what does the little *xmit*
light on the radio mean?", but that never happened.

The funny part of the story happened as the pilot was explaining
some of the navigation receivers that are typically used when
flying on instruments. He explained to his passenger that, yes,
he had taken some IFR training, and had about 20 hours logged, but
was not yet rated for IFR flight on his own. Then he explained to
his passenger (keep in mind that this is on Seattle Center frequency)
that a "handy" thing to do with his new-found skills was, if he
encountered a cloud layer that prevented him from climbing to his
desired altitude, he would just file an IFR flight plan, punch through
the clouds, then cancel IFR and continue to his destination. He told
his passenger that, well, no, it wasn't really legal for him to do
this, since he isn't IFR rated, but *they* don't know that. Right
then, a very strong transmission (from a no doubt frustrated controller
having to monitor this drivel) came on saying "but we know that now!!!"
I wonder if this guy had any company waiting when he landed? I
certainly left the field having had a good laugh that day!!

Most likely they were bluffing..

But, there is equipment out there that will allow you to graph a transmitter signature. Get a serial number from it..? Hahaha.

Triangulation.. ever been on a foxhunt? If you can't afford the major equipment.. you'll use anything you can. It has worked, but with much effort and lots of errors. Then again, I'm not the world's best at trangulation.

Here in Los Angeles, our bands are packed with jammers and bootleggers. So, we learn to just talk around them. Hams aren't supposed to talk to bootleggers anyway.. shucks. :-P

The trustees of one local repeater in Detroit area sent a mailing
out to their members, asking them to refrain from such silly
chatter about Triangulation and RDFing , and what would be "done"
to the offending (and offensive) party. The repeater trustees did
indeed have access to Doppler and conventional RDF equipment, including
"sniffers," and a few hams well-versed in hidden transmitter hunting.
One of the parties was located and informed via phone or mail that his
identity was no longer a secret. He was not heard from again, at least
on that machine. Many clubs do organize "fox hunts" to develop
technical skills at DFing.

>"If the opposite of pro is con, is the opposite of progress, Congress?"

>P.S. If you happen to have frequencies that the national networks use (ABC, CBS, NBC, ESPN, etc.) please post them too.

Technically, listening to Remote Broadcast is prohibited by the ECPA (although this fact doesn't receive much publicity). Enough said.

Just about every available frequency licensed in the Broadcast Auxilliary service in used in LA for one purpose or another. Further, the 450-451 MHz band (and the corresponding 455-456 MHz band) is fully allocated in 12.5 KHz steps nearly to the end of the band. Today, just about any breaking story or anything else of importance is communicated over cellular phone.

Unfortunately, I do not have a nicely formatted list in electronic form for you. I could post (or send FTP) all of the FCC records for entire BA service (about 6,000 records as of January, 1994>.

The Southern California edition of Police Call (*not* the one in Radio Shack) should serve as a good starting point. I have argued with Gene Hughes (sic, Cursin) for years over the format of the news media section, but has never changed it.

If you live in LA, you could come to the RCMA local chapter meeting at the Alcapulco restaurant in Santa Monica (by the airport) at 7pm on the 2nd Wed. of the month. (talk-in on 146.945 -200 pl 114.8?)

If you are in the industry, I would recommend subscribing the "Remote" newsletter which is put out by the local broadcast frequency coordination group.

Enjoy (but don't listen),

Wayne

I have heard that the Regency HX-1000 scanner was one of the best ever built, particularly for VHF Hi-Band. How does it compare to the current or upcoming Uniden and GRE offerings for VHF Hi performance? What kind of price does a used HX-1000 go for?

Eric

Cellular phones have serial numbers that are transmitted on the air and
thus make easy ID'ing. I can't say if the RS 440 HT uses that technology
yet but my company was involved in introducing such a system to every new
transceiver manufactured. The FCC is currently pursuing such legislation
and will be phased in w/new transmitters. We demo'd a combination analog and
digital ASIC (Application Specific IC) that would only allow transmissions
once when an ID was entered. Breaking such a system would not be easy but
my knowing better, every measure has a counter-measure (expensive, in this
case). The triangulation is quite easy. 2 hams w/DF'ing equipment could
get an easy fix in a matter of seconds. The rest is following the vectors
on a detail map, move in on the suspect, and wait for another trasnmission
(they always do). The truth is, when people go on the prowl, they don't
let in on it, they want as many transmissions they can get.

J.D.,

Depends on the resources of the people doing the DF'ing. We isolated a
transmitter to a local Radio Shack employee playing w/a 2 M HT. It took
us 3 keyups and less than 90 minutes to nab him. A few of us with hilltop
locations really have an easy time getting a bearing and usually get called
on to help in these cases.

I have a copy of the New York State traffic laws, and in this they have a section regarding scanners. I was wondering what the people out in electric land intrepret this as.

Section 397 Equipping motor vechicle with radio receiving sets capable of receiving signals on
frequencies allocated for Police use

397. Equipping motor vechicles with radio reiving sets capable of receiving signals on the frequencies allocated for police use. A person, not a police officer or peace officer, acting pursuant to his special duties, who equips a motor vehicle with a radio receiving set capable of receiving signals on frequencies allocated for police use or knowingly uses a motor vehicle so equipped or who in any way knowingly interferes with the transmission of radio messages by the police without first secured a permit so to do from the person authorized to issue such a permit by the local governing body or board of the city, town or village in which such person resides, or where such person resides outside of a city or village in a county having a county police department by the board of supervisors of such county, is guilty of a misdemeanor, punishable by a fine not exceeding one thousand dollars, or imprisonment not exceeding six months, or both. Nothing in this section contained shall be construed to apply to any person who holds a valid amateur radio operator's license issued by the federal communications commission and who operates a duly licensed portable mobile transmitter and in connection therewith a receiver or receiving set on frequencies exclusively allocated by the federal communications commission to duly licensed radio amateurs.

Besides having a bunch of stupid run on sentences, am I correct in believing that if I am a licensed amateur radio operator (which I am), that I may equip my motor vehicle with a scanner. Also, do I need to have say 2m frequencies inputted into my scanner???
Any comments,

Steve

Does anyone have this radio, and how do you like it. I like the fact that it is computer controlled. Do you get any interference from the computer??? Also if I place the scanner across the room, will I be able to see what frequency it is on. In other words is the display similar to that of the 800xlt. If you think this radio stinks, what others that are computer controlled are good. I believe that the going price for this radio is about 289 new, with software, no cable. Also is the cable a regular serial cable. Thanks...

A few years ago a friend of mine had his car broke into and hid radios
stolen and guess what? Yes a few days later a guy came on our closed 440
rpt. and asked if the radio was working. He said he had found the radio ;}
To make a long story short several of us talked to him and i said i had a
friend who worked at a radio store and might be interested in buying the
radio if he was interested in selling. You got it he bit hook line and
sinker. with a little coordination on other freqs while we kept him
talking a meet was set for the buy. A call to the local PD and a wireless
mike and a few undercover units and he was caught. As a kicker one of
his buddies decided to see if he could get away and after a short pursuit
he was also caught. This of course just added to his troubles. All but
one of the radios stolen were recovered. Remember criminals are stupid, if
they were smart they would be sitting around listening to scanners like
us.

: > * authoratative statements that that is not true.
: >
: > * examples of digital phones being hacked.
: >
: > either email or this newsgroups - thank you!
: >

: Hello,
: I had the same problem two weeks ago, asking myself about buying an secure
: digital phone (GSM for Europe).
: I made a simple call to Motorola in Switzerland.
: The digital cellular (GSM) works like this:

: - On the same cellular channel (200Khz wide) you'll find 8 users.
: - This 8 users are sending digital packets all 1/4,7 secs in no specific order.
: - All packets are crypted with an changing code.

: So the problem is clear. For the hack you need:

: - A FM wide band (200Khz) scanner.
: - The software you will find in the developpement lab of Motorola 8-).

: The developpement of a new digital phone concept cost about 2 Million $.
: But if you really want to try the crack you must use an R&S Testing Equipement.
: That's the only solution for the moment. This equipement was build to test
: the cellular network. The hacker will find he's pleasure for only 25000 $.

: Conclusion: it's perhaps possible, if you have money to spend for the fun.

: All best, Peter.

) Obviously none of you read Wired! In the first or second issue
) (I forget which), there was an article about a couple of hackers hacking
) a digital phone! Without buying a buttload of software. Get real -
) anything can be hacked on street level, and will be, shortly after it's

) release.
) Hurricane

I want you to tell me what you're thinking!
Digital encryptions... Is this the future dead of your scanners?
All best, Peter.

5132. Question : Possible to make a scanner ??

Hi,

Sorry if this is a stupid question. I am new and very interested in scanners.
I was just wondering if it is possible to assemble/"make" a scanner
from scratch - I mean going to the electrical shop to buy those transistors,
diodes, etc and assemble it up.

If it is possible, is there a guideline outhere where I can download.

Thanks.

It is my understanding that the exemption for HAMs does *not* cover scanners. The exemption recogizes the supremecy clause of the
Constitution. However, the device in question, a scanner, is not Federally
licensed so that it is well within the state's right to regulate it as it
sees fit (no matter how misguided).

BTW, NYC has a similar law that echos the state VTL.

5140. Is a Pro-39 Any Good?

Newsgroup: rec.radio.scanner
Date: 1994-06-16 14:16:32 UTC
From: robert.gruen@sdrc.com
Message-ID: <8754@heimdall.sdrc.com>

I have recently purchased a Radio Shack Pro-39 Scanner and I was basically wondering if I made a good purchase or not (I know its a little late now but...)? It does cover most of the 800 and 900 ranges as well as just about all of the low stuff. Can anyone give me any feedback?

Thanks!

Bob Gruen

5144. Modify TV angtenna?

Newsgroup: rec.radio.scanner
Date: 1994-06-16 15:09:40 UTC
From: gillen@cais.cais.com
Message-ID: <2tppvk$6pe@sun.cais.com>
Source record: 272991

I've inherited the smallest Radio Shack VHF/UHF TV antenna (3 elements on VHF) and have thought of shortening 2 of the elements to make it look sort of a log periodic, which would hopefully improve the higher freq coverage a bit.

Anybody have any comments/ideas/suggestions on this no-cost project?

Should such a converted TV antenna be mounted vertically for scanner use?

Yes, but with one addition. The scatter of a light source that is pulsing.
They need that pulsing to "get the goods" on you.
Michael

I'll double that feeling. My Ford F150 had a second plug with a lid too. It
was very prominent in their flyers when I was buying the truck, so it must
have been a big selling item for people who use the truck for work.

My latest vehicle (a Ford Tempo) has A/C vents with a lower edge that
nicely holds the belt hook on my scanner, so I have good access to it. But
I find the speaker output is still rather weak, even with the better
position. (It's a radio shack model, of course). I may have to invest in
that external speaker too...

BUYING A USED SCANNER RADIO |

by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or |
in part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without |
permission of the author. Free distribution is |
encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a |
mobile or base model. Portable scanners are subject to |
more physical abuse and many have been dropped. If a |
radio has been dropped, the laws of probability dictate |
that the first point of impact was probably a corner, |
so be sure to examine each corner for evidence of |
trauma. |

Scanners used in mobile service are subject to |
vibration, dust, and temperature extremes. This |
shouldn't dissuade you from buying a used mobile |
scanner, but be aware of possible complications. |

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic * Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to | find out their current rates. G & G Communications | (telephone 716-768-8151) is another scanner repair | company. This family owned company repairs scanners | and stocks parts for several older models. They are | located at 9247 Glenwood Drive, LeRoy, NY 14482. |

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should | avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio | Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, | narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit in which crystals were held in a rotary "turret."

The earliest scanners, like the first Bearcat models, | did not provide individual channel lockout capability. | Other models, like the SBE Sentinel, employed a | "Channel 1 Bypass" switch so a user could lockout | channel 1.

The first scanners came in single band models, followed | by multiband models. As two-way radio users started to | populate the 450 - 470 MHz band, consumers were forced | to pay a premium for UHF scanner coverage. Some | multiband scanners, like the Electra's Bearcat III, | required an optional circuit board for each band. |

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

More Modern Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. The older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many

scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to

scan. 10 pairs of search limits. Search and store |
("memory write") scan mode lets you store 100 |
frequencies instead of the 20 in R7000. Another R7100 |
improvement is that you can program up to 100 channels |
for the R7100 to skip while searching. R7100 has 2 |
VFOs ("windows"). Both the R7000 and R7100 scan slowly |
compared with PRO-2004 and PRO-2006, and that's a |
drawback. Both the R7100 and R7000 employ a noisy |
relay, activated when the receiver is tuned to |
frequencies above 520 MHz. Scanning a mixture of VHF |
and UHF frequencies serenades the Icom user with a very |
annoying clickety-clack, clickety-clack! |

UNIDEN/Bearcat and Electra/Bearcat |

Bearcat III (Electra): 8 channel crystal controlled |
scanner. Requires optional front-end circuit board for |
VHF-low, VHF-high, and UHF bands, but only 2 boards can |
be installed within the radio at the same time. Two |
crystal filters. No aircraft band coverage nor rescan |
delay. Front mount speaker sounds good. Strong local |
oscillator radiation often causes interference with |
other scanners in the same house. |

Bearcat IV (Electra): 8 channel crystal controlled |
scanner. Newer version of Bearcat III but has better |
IF filtering and contains front-end circuitry for VHF- |
low, VHF-high, and UHF bands. No aircraft band |
coverage. Three crystal filters. Front mount speaker |
sounds good. No rescan delay. |

Bearcat 12 (Electra): One of the last decent crystal |
controlled scanners. 10 channels. Variable scan speed |
up to 20 ch/sec. Single delay on/off switch. Front |
mount speaker sounds good. Manual contains schematic. |
Selectivity is poorer than programmable models, like |
the 300, allowing adjacent channel interference. |
Covers VHF-low, VHF-high, and UHF bands but no aircraft |
band coverage. Crystal positions must be arranged by |
band. |

BC101 (Electra): First Bearcat synthesized unit. 16 |
channels, no priority. Frequency programmed in binary |
by setting toggle switches on front panel after looking |
up code in code book. No frequency readout. Uses |
custom IC for CPU, now discontinued, so factory |
authorized service is no longer available. I have four |
of these units. DC operation requires optional mobile |
power supply. speaker when squelched. Belt clip |
chintzy, but can be directly replaced with better clip |
from Kenwood TR2600A. Like the MX3000, all 30 channels |
are in a single bank, and lack of direct channel access |

make this model more difficult to operate. Low | discount price makes this best choice for programmable | portable. |

BC100 (Electra): First programmable portable scanner. | Be prepared for at least one repair in the first year. | Early units, with threaded antenna connector, have high | frequency of repair, particularly LCD readout, | keyboard, and battery holder. No battery backup. Poor | case design in early units caused battery to disconnect | from radio, resetting microprocessor and clearing | memories. No priority channel or aircraft band. Some | people swear by the BC100, others swear at them. |

BC220 (Electra): 20 channels. Reasonable number of | features but 20 channels doesn't seem enough. Service | Search for Marine and Aircraft. LED readout. Good | scanner, but tinny audio. |

BC20/20 (Electra): A BC220 but with 40 channels. A | maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio. |

BC250 (Electra): 50 channel discontinued model. Rich in features, but lacks aircraft band and 144-146 MHz. | Search and Store feature extremely useful for finding | federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden. |

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt

regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward. |

BC300 (Electra): 50 channel top of the line scanner. | Service Search feature contains 11 ROM banks of | preprogrammed channels. Switching power supply failure | noted in early units due to insufficient capacitance - | component value was changed in newer units. Schematics | show at least 100 components changed between earliest | and later units. Preset squelch pot, mounted | internally on circuit board, misadjusted in new units - | adjustment usually required after burn-in period. Good | sensitivity. Built in clock. I leave it on 24 hours a | day. This is a favorite. |

BC350 (Electra): 50 channels in 5 banks. Includes | aircraft. Used to be Bearcat's top of the line, | overpriced scanner but never very popular, now | discontinued. Dual use keyboard and display allowed 8 | text characters to be associated with each channel, a | feature clumsily implemented, and awkward to use. | Units plagued with various hardware problems including | bad memory ICs and short life power transformers. | Firmware bugs without cures. The BC300 is a much | better scanner than the BC350, and at a lower price. |

800XLT (Uniden): 40 channels in two banks. Covers | 806-912 MHz, as well as of vhf, uhf, and aircraft | bands. Receives 10 meter fm and all of 6 meters, as | well as federal portions of vhf and uhf bands. Fewer | birdies on vhf-lo band than other scanners. Scans and | searches very fast. Clean, robust audio output. | Extremely sensitive, but very prone to overload by | strong signals when connected to outdoor antenna. Too | much play (hysteresis) in squelch adjustment - can be | improved by changing one resistor. Positive terminal | in memory backup battery holder installed backwards in | early units, allowing memory loss when scanner | unplugged from AC outlet. Tunes in increments of 12.5 | KHz on 800 MHz band, whereas cellular telephones are on | 30 KHz channels. |

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack. *

BC200XLT (Uniden): Excellent 200 channel version of | BC100XLT portable scanner but includes 800 MHz band. |

10 priority channels. Unique feature tells whether a | given frequency has already been memorized. Decent | leather-like case. Slide-on NiCd battery pack. |

Regency

TMR series: First generation crystal scanners. Come in | all varieties of band coverage. Models with both UHF | and VHF bands must use separate antennas for each band | (disadvantage in mobile installations, but can be | overcome by connecting two front ends via a capacitor). | Not sensitive enough to cover the entire 30 - 50 MHz | range in a single model. There three versions of VHF- | low band coverage depending on the part of the 30 - 50 | MHz band covered (LL, LM. and LH). TMR scanners use | unsocketed incandescent bulbs for channel indicators | which require periodic replacement. Easy to crystal: | Radio Shack crystals work well. TMRs usually $2 and up | ad hamfests, often in poor condition. Don't pay more | than $50, even if mint. Front ends must be tuned for | selected portions within the bands for best | sensitivity. Wide IF selectivity troublesome in | urban/suburban areas. Primitive digital scanning | circuitry may become confused at times. but power | off/on restores sanity. Replace aging capacitors in the | scanning circuits. |

ACT series: Replaced the Regency TMR units. ACTR are | mobiles and ACTE series are base units but share | similar circuitry. Look for the later ACT series, | e.g., ACTR20, used light emitting diodes for channel | indicators instead of incandescent bulbs. Available in | 1 to 20 channel models - most are multi band receivers. | Somewhat wide selectivity. Not all that bad a deal if cheap. |

WHAMO-10: Regency's first synthesized scanner. | Discontinued long ago. Appearance more like a crystal | scanner, with a single LED per channel. User has to | break off teeth on a metal 'comb' for each channel | according to a code book. External frequency control | unit DFS-5K optional. UHF VCO reference oscillator | drifts on some units. Soldered sheet metal shields | around some circuitry make access to some components | difficult for servicing. Comb sockets prone to bad | connections after moderate use. Not recommended due to | maintenance difficulties. |

K500: Nice wood-like cabinet. Discontinued 40 channel | model with every feature Regency could dream of in one | scanner, except aircraft band. Idle tone bypass feature | for mobile phone stations works about 50% of the time. |

Weather alert feature. Service Search in several banks. | Search and Store facility not implemented as well as | BC250, but better than none. Built in clock when radio | off or in manual mode. Can be programmed out of band. | Reasonable performance, but sensitivity could be | better. Spring contacts on membrane keyboard may need | soldering after prolonged use. |

K100: Bare bones version of the K500. 10 channels, no | priority feature. Same wood-like cabinet and reasonable | performance as K500. Spring contacts on membrane | keyboard may need soldering after prolonged use. |

M400: 30 channel replacement for K500, but now discontinued. Service Search, but no aircraft. Easily | programmable out of band. Built in clock when radio off | or in manual mode. Backlit keyboard good for night | viewing and mobile use but generates RFI into nearby SW | receivers. A favorite. |

MX3000: Discontinued 30 channel replacement for M400, | but basic features only. Nice lit keyboard, but may | cause RFI into nearby SW receivers. Easily programmable | out of band, but no aircraft. All 30 channels are in a | single bank, and lack of direct channel access make | this model more difficult to operate. Good first | scanner. |

M100: Discontinued 10 channel unit. Same as MX3000 | except different color and fewer channels. Nicely lit | keyboard, but may cause RFI into nearby SW receivers. |

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no | AM aircraft coverage. Built by Azden. Very sensitive on | UHF, but annoying audio hiss leaks through speaker when | squelched. Belt clip chintzy, but can be directly | replaced with better clip from Kenwood TR2600A. Like | the MX3000, all 30 channels are in a single bank, and | lack of direct channel access make this model more | difficult to operate. Low discount price makes this | best choice for programmable portable. |

HX650/H604: 6 channel crystal portable. Likely made by | Sanyo. Same as Fannon and Bearcat Thin Scan units, | (except that Bearcat has 10.8 MHz IF frequency, and is | harder to get crystals for), but scans faster. Small | size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack1

PRO2004: Top of the line, wide band scanner for 1987. *
After a diode is cut, enjoy continuous coverage from
25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300
channels in 10 banks of 30, backed up by conventional 9
volt alkaline battery. Any channel can be designated
the priority channel. Scans and searches fast. Lots
of well designed features, like 10 pairs of search
limits, Lockout Review, default search increment and
emission mode. Sound Squelch allows skipping dead
carriers during search or scan. Metal cabinet, good
internal construction and shielding, but no mobile
mounting bracket or DC power cord. Soft touch membrane
keyboard. Good sensitivity and selectivity. Very good
radio.

PRO2005: Radio Shack's top of the line scanner for 1989 |
and scanner of choice. Essentially a size reduced
PRO-2004 with surface mount components and 400
channels. Some people think the small knobs, smaller
display, and plastic cabinet are a setback from the
2004. The smaller size, real rubber keyboard, and
vertical front panel make it easer to use mobile,
although there is no mobile mounting bracket available
and the keyboard is not backlit. More sensitive than
the PRO-2004 but 800 MHz signals leak through into the
commercial aero band. Highly recommended. |

PRO2006: Radio Shack's 1994 top of the line scanner. |
Essentially the same as PRO-2005 but scans faster. |
Probably the best scanner made to date. Highly |
recommended. |

PRO34: Portable scanner with 200 channels and 800 MHz
coverage. Ten "monitor" channels. Operates from AA
cells. Slow scanning, low audio output, and chintzy
plastic case detract from an otherwise good
performance. No decent leather case available from
Radio Shack. If you need a portable with 800 MHz, get
a Bearcat 200XLT. If you can't get a 200XLT, get a
PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 *
banks, LCD display and raised rubber keys. Lots of
memory but scans too slowly and lacks 800 MHz. Ten
"monitor" channels. Radio Shack seemed to have an
overstock of 2021s as they were on sale for such a long
time. Close out price dipped to about $200, which made
it a nice scanner for beginners.

PRO2001: Early, discontinued single bank 16 channel *
programmable. Reasonable coverage of the 3 traditional
bands, minus aircraft band. LED digital display as
well as an LED per channel. Mechanical lockout switch

for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: Discontinued 8 channel VHF-Lo/Hi base unit. No * UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Front mounted, vertical speaker always a win.

PRO2003: Radio Shack's 1986 top of line. 50 channels + * 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft * band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled * portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig2

4530: Discontinued Japanese 10 channel crystal * controlled 3 band unit. Also available under Plectron

name but in different cabinet. No aircraft band.
Deluxe features like priority, trimmer capacitors for

---

1. Radio Shack scanners are manufactured by General | Research Electronics of Tokyo (GRE) and Uniden.

2. Craig is a division of Pioneer.

- 2 -

netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

>from scratch - I mean going to the electrical shop to buy those transistors,
>diodes, etc and assemble it up.

Sure it's possible. A friend of mine builds live steam locomotives in
his basement. Anything is possible to build if you put enough effort
into it. A better question is whether it's practical. Today's scanners
use custom chips that you aren't going to find at the local parts store.
To replace those in your design, you're going to have to use a lot more
discrete logic and a general purpose microprocessor that you program
with the desired scanning algorithms, if you want your scanner to work
like commercial scanners. (You can make an analog scanner with swept
oscillators like those of 20-30 years ago, but I doubt that's what you
want.)

A scanner is nothing more than a wide range receiver that can
automatically tune itself and stop when it detects a signal.
That part is easy. Receivers aren't hard to build, and automatically
tunable oscillators aren't hard to build (typically a programmable
synthesizer in modern scanners, though some still use switched crystal
oscillators). The circuit for stopping on the center frequency of a
detected signal is a little tricky, but not hard either. What becomes
harder are the programmable functions of modern scanners. Commercial
scanners use custom microcontrollers to do that. You'll have to build
a small computer and program it to do the same things. (You can interface
a receiver to an existing computer, like the PC, and do the programming
there, but usually you'll want to use one of the single chip field
programmable controllers on the market.)

If you want features not available on commercial scanners, then you
will have to build your own. But if you are satisfied with the features
of existing commerical scanners, their low price means anything you
build will cost more, and take much more time to do, than it's likely
worth.

I thought that wouldn't be true for the first ten minutes, that is, for the
first 10 minutes there would be no way to be certain that the individual was
unlicensed. The rules require that a call sign be transmitted
every 10 minutes and at the end of the last transmission, but not at the start
of a conversation. It would be *odd* not to give your call up front on a
repeater, but I don't think you could *necessarily* conclude that the
individual was transmitting illegally. If the whole conversation took place
within 10 minutes, then there would be no way for others to be certain that
they were talking to an unlicensed station.

I know that years ago a station was required to give, not only his own
callsign, but also the callsign of the other station. In fact, the
only pink slip I ever got was because of me not doing that in a
contest. Nowadays that's not required, so I wonder which law is being
violated by talking to an unlicensed station???? I just skimmed over
97.113 and it wasn't there, either pre- or post-December 93.

5155. PRO2006 Modification??

Newsgroup: rec.radio.scanner
Date: 1994-06-16 19:14:06 UTC
From: gregt@byter.win.net
Message-ID: <6@byter.win.net>
Source record: 273004

I would appreciate advice on how to modify the RS PRO2006 scanner
to be capable of monitoring cellular channels. Does it require
modification in order to do this? I understand the legal issue
here and would not think of violating anything, but who knows what
may be required in the name of civil defense in the future??
Thank you for you time and consideration.

|> ---------------- gillen@CAIS.COM ---------------

Actually, it is a log periodic. It covers from roughly
50 MHz to 220MHz. Try it first as is, then see if your
mod helps above 220. Vertical polarization is a good idea.
You might want to use a non-metallic mast if you mount it
in that way.

Post and let us know how it works!

Well, I think that you probably become illegal when you become aware
that the other station is not licensed.

In this real-world case, I am prepared to forgive the hams who talked
the crooks in. Heck, the FCC has a hard time enforcing malicious
violations of part 97. I don't think that they would have a problem
(or even be aware) of the tiny violation illustrated here. I don't
think that they would disagree with relieving the crook of the stolen

radios, as this would prevent problems in the future.

In the case of jamming, it is best to ignore the jammer. They want recognition. If they don't get it, they go away. If you acknowlege them, they'll stick around. Simple as that.

In a previous article, rling@cad3.uccb.ns.ca (omp.vuw.ac.nz!actrix.gen.nz!mklee
) says:

>Anyone had any experiences with the Grove Scanner Beam?
>Is it any good for cellular and is it well made?
>Does it work better with a rotator?
>I will be using it with a Pro2006.

Ron,

I bought Grove's beam a few months ago. Anyway, when I ordered it,
I was naive and believed that it was some sort of special 'scanner'
antenna. In reality, it is only a tv antenna. You should be able to
go out and buy one...but I don't know if it would be for less.

I also bought a rotator for it. Unless there is only one thing you
want to listen to (ie...a police station located in a certain direction
to your house), you will probably need a rotator.

Unfortunately, I had to return both items because there was nowhere
to put the rotator and antenna. The only place I could put it was
on the chimney. The chimney mount at RS was not sturdy enough to hold
all the weight. Part of the problem is that my chimney needs some
fixing (it's falling apart).

Hope this helps...

In actuality, frequency counters aren't that sensitive. You would have to be very close to a transmitter to be able to receive the frequency in use.
Now, for a scanner that has something similiar to what you describe would be the Uniden Bearcat 2500. It has an auto search and store feature that searches through the frequency ranges and when it finds a transmission, automatically stores it in a memory channel and continues.
There may be other scanners with this feature, both present and in the near future.

MRH> it with a 15 Mhz crystal. It works okay. Scanning speed up to about
MRH> 38.5 channels / sec.
MRH>

Hi, Mick...
This modification is one that is described in Bill Cheek's Scanning
Modification books. He recommends not going past 16 Mhz as this will
overwork the microprocessor.

In case you haven't noticed, there is a side effect to this
mod...delay time is cut in half.

MP> Can anyone tell me which states (hopefully one that neighbors CA) sell
MP> something like this? Approx. cost? Works with any phone system? Any
MP> other details.

Hi, Mike...
The device you seek is for a system called Caller ID. It is offered by
several Bell companies, depending on whether it is authorized or not by
their respective control agencies.
Basically, when a subscriber has this box, it will display the phone
number and in some cases, the name of the caller when the phone is
ringing. Some boxes usually have a memory and will store the number for
later retrieval.

You can't just buy a Caller ID box and hook it up. The central office
of the phone company must have the equipment installed into the network.
Then, the phone company has to turn it on when a subscriber desires the
service.

rg>

Hi, Bob...
Yes, it is legal to monitor the Space shuttle. Matter of fact, it may
be as close as your scanner.
Many ham repeaters, when given permission, will re-broadcast shuttle
transmissions. Check the 144-148, 220 Mhz, and 440 Mhz range for ham
re-broadcasts.

-=> Quoting SDS910 to All <=-

SD> From: sds910@aol.com (SDS910)
SD>
SD> There was a tremendous amount of e-skip this past weekend coming in
SD> to NYC, particularly noticeable at TV channels 2-4. We were able to
SD> copy TV stations from several cities in Louisiana (!), Tampa, FL and,
SD> oddly, Illinois!
SD>
SD> All this was done on a portable set with a pair of rabbit ears....
SD>
SD> Never mind how the PRO-2006 was buzzing! ;)
SD>
SD> Steve Shorten

Hi, Steve...
Yes, I heard the skip a bit last week. I was picking up transmissions
from Kentucky. I have occasionally picked up some fire dispatches 10 years
ago or so from New York in the 33 Mhz range, I believe.

I suspect you were picking up WBBM TV in Chicago. Yes? They are on
Channel 2.

-=> Quoting John Ross to All <=-

JR> From: jdross@sdcc13.ucsd.edu (John Ross)
JR>
JR>
JR> the people on the repeater. The hams referred to him as a
JR> boot-legger a few times, and then one said "He's using a Radio Shack
JR> hand talkie, and we have the serial number. We know where he lives
JR> and we'll have the police knocking down his door soon now." A
JR> little while later, the same ham said, "We've been able to
JR> triangulate his position, and I'll be making my call about him
JR> shortly".
JR> My question is, were they bluffing just to scare the guy off
JR> of the repeater for the night? Is it possible to get the serial
JR> number off of the ham rig that someone is transmitting from? I've
JR> heard about triangulate someone's position before, but is it
JR> accurate enough for hams to do on their own, like this ham was
JR> talking about? Any info would be great!

Hi, John...It would be pretty far-fetched to know the serial number and the type of unit he is using to make the offending broadcasts. Triangulating someone is not impossible. Matter of fact, about 6 months ago, someone had broken into a police frequency in the 470 range. They were carrying on and making abusive statements on the radio. An officer, who is also a ham, was called in to track them down. They were making broadcasts on a handheld radio while driving around in their car. They happened to be parked when the ham/officer was able to catch them in the act. The suspects were apprehended and charged with improper use of a ham radio and making broadcasts on an unauthorized frequency.
Some hams can afford expensive equipment. It's what they enjoy doing, so I would believe that these operators were able to pinpoint his location.

Jerry

5167. How to build an attenuator?

Newsgroup: rec.radio.scanner
Date: 1994-06-16 23:49:20 UTC
From: weisen@alw.nih.gov
Message-ID: <1994Jun16.234920.23755@alw.nih.gov>
Source record: 273005

Well, I'm embarrassed to say it, but I graduated school (a couple of years ago) with an Engineering degree and somehow managed *not* to take even an intro circuits class. I now regret that and am reading Wiley's "Electronics" intro book, but I have a problem that I'd like to solve now. I want to build an attenuator that will give me about 3 dB attenuation over a portion (or all) of the 800 MHz band.

I live in Arlington, VA where we have a really powerful 800 MHz trunked signal that is loud and clear everywhere in the county. The problem is that my Pro-43 sees the "data" noise on the control channel smeared all over other nearby channels when anywhere near an antenna. They must have antennas in a few locations around the county, because I find hot spots while driving around. The only solution that I've found so far is to remove the antenna entirely. I generally find that I still have no problem receiving Arlington's trunked system but I, of course, lose everything else that I listen to. So, I'm hoping that by building something to knock about 3 dB of signal off of 856-861 MHz that I'll solve the problem. I'd like to build something that is relatively flat over that region, but it could take a while to roll off outside that region since I tend not to listen to anything else above 800 MHz.

I have absolutely no experience designing such a circuit (or, really any non-digital circuit at all), but am handy with a schematic and a soldering iron. So, can anyone recommend a good place to look for such info? I guess that I could get a book on filter design, but I have a feeling that it would immediately go over my head.

I'd appreciate any tips that you could provide and would be glad to summarize if people don't think that there's a general interest.

Regards,
Neil

I am new to Columbus and really want a frequency list for the
area. Police, fire, et cetera is what I am looking for. Also, I live
about 200 yards from the Ohio State University hospital, so those and any
other OSU frequencies would be greatly appreciated. Thanks in advance!

> for long periods of unattended scanning and review its finding
> at my leisure.

Yes, I assume you can do that with the OPTO unit, but unfortunately, to listen to those frequencies, you will have to have the computer dedicated to the scanner, or punch them in manually. My preferred way is to have the computer find them, then program them into the scanner memories. Then I can listen to them without having to tie the computer up. I can do that with my HB-232. Another interesting device is the PRO-232, which apparently, is similiar to then HB-232, but cheaper.

The OPTO does give you CTCSS and DTMF detection, but I am not convinced that it gives you that much more than the HB232 product, in practical terms, and less in some. Personal opinion, obviously, and I have not played with the OPTO unit to give it a fair shake.

drranu@lamar.ColoState.EDU (Emarit Ranu) writes:

It is possible to triangulate a transmission. Ham operators sometimes
run a fox hunt where they try to locate a transmitter. Not difficult
to do and in the case of some bummers that have tied up repeaters,
this is done. So if enough people get mad enough, it will be done.
Ham operators tend to be very self policing and operate within the
law almost 100% of the time.

First the rpt they were on was not what you would call a busy system.
Everyone on the rpt knows each other and has for years. We had all been
told about the stolen radios. So it was obvious when a couple of days
later some guy comes on wanting to know if the radio works and saying he
found it that not only was he not licensed but was the probably the guy
who stole the radio. In the case of most jamming i agree with the general
view i have seen posted "IGNORE THEM" but in this case i didn't have a
problem doing what we did. If it had meant a note from the FCC so be it.
It's kind of like breaking a speed law to catch a hit and run driver.

Source record: 272930

Steve, I purchased the MR8100 in 1990 and enjoyed having in my car for a couple of years. I have not tried it for use as a base scanner and would imagine the computer would cause a great deal of interference depending on the type of antenna you use. After using the MR8100 for about 18 months the alpha numeric display started to show phantom numbers and other oddities. The software that came with the unit was meddlesome and very time consuming. (Uniden has probably upgraded the software.) The obvious plus is the ability to read the station you ar monitoring. I currently use the MR8100 on my boat and use about 30 of the 100 channels...

Since a scanner is a receiver, the use of a scanner in concert with
a transmitter (or a transciever) should cover the situation.

>The exemption recogizes the supremecy clause of the
>Constitution. However, the device in question, a scanner, is not Federally
>licensed so that it is well within the state's right to regulate it as it
>sees fit (no matter how misguided).

The reality (not legal opinion, just my own perspective) is probably
that the police (1) rarely enforce the NYS law and (2) probably don't
do anything if you are a ham because they aren't technically competent
to determine exactly what the law might mean (or more importantly to
a cop and a prosecutor, can they get a conviction?)

In another post someone wrote:
>: Besides having a bunch of stupid run on sentences, am I correct in
>: believing that if I am a licensed amateur radio operator (which I
>: am), that I may equip my motor vehicle with a scanner. Also, do I
>: need to have say 2m frequencies inputted into my scanner???
>It says that you can have a ham transceiver (that's with a transmitter)
>that can also receive police frequencies.

If the quote from the NYS law above is correct it doesn't specify a
transciever, it only mentions a transmitter (which also includes a
transceivers) being in the car along with the receiver (and again, all
scanners are certainly receivers).

As to having some amateur band frequencies programmed into the receiver (scanner) and transmitter, that'd be a prudent precaution if the situation ever went as far as to the cop (or court) trying to make a determination that the equipment was set up for amateur band operation.

Bottom line again seems to be that there has been no prosecution of any hams under the NYS law (or NYC version), at least as far as has been reported in the pages of ham magazines like QST and CQ. And you can bet that any ham charged under the NYS law would very likely have reported the incident to the ARRL (publishes QST magazine to ARRL membership)

That doesn't mean that an isolated case has happened and just not been reported, but it does (IMHO) seem to show that a licensed ham is usally insulated from harrasing prosecution under the NYS law.

Again, just my opinion, and more good reasons for scanner enthusiasts to consider becoming a ham, especially now that there's a "no-code" technician class license that you can strive for.

Anyone interested in learning more about becoming a ham can request a free information package from the Amateur Radio Relay League (ARRL) by calling 1-800-326-3942 and requesting one.

Cheers,

5182. SCANNER BAN COMING

Newsgroup: rec.radio.scanner
Date: 1994-06-17 13:43:00 UTC
From: chuck.zeps@dt-can.com
Message-ID: <fe.1123.3070@dt-can.com>
Source record: 272947

From a CANADIAN PRESS article of Friday 17 June 1994

PHONE SCANNERS LIKELY TO BE BANNED

OTTAWA - Chances are "very high" the government will ban digital scanners that pick up cellular and cordless phone conversations, says Jon Gerrard, secretary of State for science and technology. The Federal advisory council on the information highway is poised to recommend outlawing manufacture and sale of the scanning devices - advice the government is likely to accept, Gerrard said Thursday.
"I think the case was made very eloquently and quite convincingly", he said at the conclusion of the councils second full meeting. The 30 member council, appointed this spring, is advising the government on the so-called information highway - the burgeoning web of telephone, cable, satellite and computer networks.

SECURITY ISSUES: " The Government is very concerned about privacy and security issues," said Gerrard, who attended the two-day meeting. There are more than one million cellular phones, well over two million cordless phones and some 900,000 analog scanners across Canada.
The wireless phone industry is shifting to digital signals that can't be picked up by cheap analog scanners.
But some are concerned that scanners capable of decoding digitized voice communications could soon become common in corner electronic stores.
Legislation would nip the new breed of scanner in the bud , said Gerrard.
"There's no point in people investing money developing commercial digital scanners if that's the direction were going to go," he said. "And I suspect , based on the recommendations of the council, that the chances of that are very high."

Source record: 272961

Yes, I listened too the shuttle on many passes, on 145.55. Their
packet
'robot' will accept connect requests, assign a number to the caller,
then
disconnect to be ready for the next calling station. Each overhead
pass is
quick, just a few minutes. But, I copied the packet activity quite
nicely and saw many Hams get a contact. They are now entitled to
collect a QSL card confirming their contacts.
The astronauts are always very busy, and rarely freelance on FM
voice. Most (almost all) of their 145.55 voice contacts are pre-
arranged with school groups who are chosen months in advance.
But, when freelancing they listen on any one of 6 uplink
frequencies to spread out the callers. But everyone still listens
to them on 145.55.

> - - Eric

In Bill Cheek's first Scanner Modification Handbook he shows how to replace the stock memory chip with one that has 4 additional address lines. 4 new lines give you 16 times the memory. So you wind up with 16 "blocks" of 400 channels, thus 6400 memory channels. I did this mod about 4 years ago and it works great. In his second book, he shows how to access the 16 blocks via keypad. I used dip switches since his second book wasn't out at the time. I probably only use about 5 or 6 of the blocks, but its nice to know you'll never run out of memory. There is even a mod to show you how to add 2 of the new chips to get 12800 memories... a bit silly without computer control. The mod isn't for the faint-of-heart.

The following is what the guy at the local radio store turned up with regards to putting a scanner in your car in the state of Michigan. I'm interested in hearing your interpretation of the law (The placement of the commas is confusing. Do you need only a Ham Radio license or both a ham radio license and a permit?). Also, if there is anybody who was confronted by a police officer in Michigan with regards to having a scanner in your vehicle, I'd like to hear your story. Both follow-ups and email welcome.

750.508 Vehicles equipped with short wave length radio receiving sets
Sec 508. (1) Any person who shall equip a vehicle with a radio receiving set that will receive signals sent on frequencies assigned by the federal communications commission of the United States of America for police purposes, or use the same in this state unless such vehicle is used or owned by a peace officer, or a bona fide amateur radio operator holding a technician class, general, advanced, or extra class amateur license issued by the federal communications commission, without first securing a permit so to do from the directory of the department of state police upon application as he or she may prescribe, shall be guilty of a misdemeanor, punishable by imprisonment in the county jail for not more than 1 year, or by a fine of not more than $500.00, or by both fine and imprisonment in the discretion of the court.
(2) This section shall not be construed as restricting the use of radar detectors.

Amended by P.A.1990, No. 77, 1, Imd. Eff. May 24.

[Michigan's Vehicle Scanner Law deleted]

Greg,
I carry a copy of this very law in my wallet with my amateur
license. I have talked with a lawyer regarding the interpretation of
the law, and was told very clearly that I need only a ham radio license,
NOT a license + permit. I think the permit is available for non-hams
who have a legitimate reason to carry a scanner in their vehicle, perhaps
a volunteer fireman or some such occupation. I don't know anyone who has
this permit.

Having researched this and all, I have only bothered to carry my scanner
in my car maybe a half dozen times or so in the past couple of years.

Hope this helps,
Mark

Many thanks to Bill and Bob for exploring the legal issues surrounding such an endeavor. After I had worked out the technical issues of improving the R-7000 front end to handle the environment, and developing a "DTMF Tone Remote," the legal implications never came to mind. As another poster pointed out, the best use of the device would be for high demand, media driven events. The one line limitation would substantially lower the value there.

Regardless, it is still fun to listen to wireless mics and other low power transmitters. The users don't seem to think these things radiate beyond the confines of their reception equipment. This project seems likely to become a single user device.

Hello fellow scanbots,

Are there modification plans available for the PRO-46 to increase its scanning rate? Is it possible to increase the number of channel memories in this model?

(Thanks to the person who posted the info on killing the keyboard BEEP!)

Moy Wong (moy@xp.psych.nyu.edu) Dept. of Psychology, New York University

Three people, or two if thats all you have, can locate a jammer by putting a dot on a map (you are here), then using a yagi finding a direction from whence the offending transmission comes. A compass will help you to draw a line from the direction the signal is coming from back to yourself on the map.

If two more people in different locations do the same thing the intersecting lines will give an approximate location. This does take a little practice. And if a repeater is being jammed make sure you are not sniffing the output, everyone already knows where the machine is.

In article <48.7520.464.0N50E2A7@cforum.com>, chris.conner@cforum.com (Chris Conner) writes:

While the 8100 is a great scanner for mobile use, it lacks the abiltiy to search a range of frequencies for new stations. Think of the 8100 as a 100 channel "crystal" scanner. Once the frequencies are programed in (with a computer or from the keypad) you can scan these frequencies only (of course you can always re-program a channel).

The computer is used to load the frequences and then is disconnected. It is not used in the day-to-day operation of the radio.

Hope this helps.

>
> Amended by P.A.1990, No. 77, 1, Imd. Eff. May 24.

I sounds to me like you must be either (1) a peace officer, (2) a ham
(above novice), or (3) a permit holder; or (4) the vehicle must be owned
by a ham or peace officer.

Notice that if you "equip" a vehicle that is not used or owned by a
ham or peace officer, without a permit to do so (or "so to do"), you're
guilty of a misdemeanor.

I have no idea how this statute has been applied, so I only say this
from reading it and a little experience trying to figure out statutes.

Statute-writing maxim: Why use ten words when two or three hundred will do?

I guess the media agree with you. During the OJ aprehension an
exasperated CNN/KTLA reporter said something to the effect "Listening
to the scanner is the only way to really tell what's going on."
Of course she also repeated police traffic she heard on her scanner
which, and correct me if I'm wrong, is a violation of that 1934 don't
ask, don't tell law.

Hmm, If he was talking on the ol' cell phone, and the LAPD knew it
was his, could'nt they pin-point his exact location.... using some
variation of triangulation? Seems like it would be pretty easy.
Well, if they "got him" incorporating this simplistic technology
could'nt we call it getting
"O.J.ed" ?

Cell phones, how sweet they are :)

My G.., what are we comming to?
Ban the scanners so we can not do our civil duty to perhaps assist the peace offices, but allow radar detectors whose purpose (IMHO) is to give someone the edge in not being caught violating the law. And not a single study has been done (to my knowledge) on what all these artificial waves are doing to our bodies - just authorize more and more usage for the most mundane reasons.

Message-ID: <2tus87$din@usenet.INS.CWRU.Edu>
Source record: 272968

Sure, I have them programmed in my scanner sitting right here
(I live only a couple miles away from it):
154.5400
154.6000
463.2125
463.2625
463.3125
154.5150
154.5700
461.9625

Most of the action occurs on 154.5400, they use pretty
much all codes, but it's easy to figure them out.

Mike...

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

LH> ifo. Also, if you are interested in trading a scanner for Radio
LH> controlled vehicles, let me know. I have a monster truck, an on road
LH> car and a motorcycle that I am trying to get rid of.

Hi, Lee...
Radio Shack may still have quite a few left that might be modifiable.
New, unmodified units are trickling in. Pro-43, '39 and the BC 2500 are
all capable of modification. But there are new versions of the '43 coming
out, so you will have to be careful when purchasing one. Check the model
number on back of the scanner. If there is an 'A' after the model number,
then it will not be modifiable.

DS> restore the full 800 MHz range. If you have one, please drop me a
DS> copy via the e-mail adress listed below. Thanks in advance.
DS>
DS> -Dan

Dan...

Product...Realistic PRO-2032 by Radio Shack
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz
band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as
this involves work with static sensitive devices. Any electronics store
should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p.
112.

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape
may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.

> Thanks.

Frequencys in that region are used for trunked mobile systems. At least
one of the channels in each system will have a data transmission on it
that is used to control the selection of the voice channel when a mobile
user presses his talk button. From time to time the control channel is
changed hence at times you will hear voice and at other times you will
hear control data.

: >and the LAPD knew it was his,

: Not an issue. The number goes with the phone *not* with the person.

: >could'nt they pin-point his exact location....

: Yes, and that is basically what happened. In other words, AirTouch
: (formerly PacTel> found O.J. before anyone else did. Brings to light
: some interesting law enforcement and legal problems, doesn't it?

No, I don't think so. Not, in OJ's case. It certainly qualified for the
issuance of search warrants under the wiretapping act and ECPA. whether
they did or not is an entirely different question.

: >using some variation of triangulation?
: ^^^^^^^^^^^^^
: Not necessary; particularly in a big city like LA with many small cells.

Try looking in an addition of Police Call at Radio Shcak if you live in a metro-city. If you don't, try calling a local radio or television station. They probably have a list of the codes you are looking for available from their news departments.

In a previous article, Jack Mc Gee,ev970@cleveland.Freenet.Edu says:

>The OPTO does give you CTCSS and DTMF detection, but I am
>not convinced that it gives you that much more than the
>HB232 product, in practical terms, and less in some. Personal
>opinion, obviously, and I have not played with the OPTO unit
>to give it a fair shake.

I like the idea if being able to decode the PL and DPL codes with the Opto 456- I even purchased a Pro 2006 in preparation for buying an Opto board. But I do agree with Jack that a preferable model would be to have the setup find the frequencies, then load them in to the scanner memory and use them. From what I understand, the Opto board does not talk to the scanner storage locations, and essentially shuts itself off when the comptuer interface says the associated program isn't running.

I can understand this- the way they are making the product less expensive is by having the external PC do all the work. It would probably add quite a bit of cost (hardware and development) to have the whole thing keep working in standalone mode. You would need to have memory and code to link the individual frequencies to the PL/DPL codes that go with them, and always know which channel the scanner is on.

Of course, those are the features I am looking for- a Pro2006 with Opt456 features, but will keep working in a stand alone mode.

Does this exist?

The closest I have found is a product from AIE (Automated Industrial Electronics) which did most of this, but without the computer interface, and no longer in production.

Maybe if I wait another few months there will be another model of the Opto that will do all of this...

The frequencies used by the NJ Sports and Exposition Authority at the Meadowlands should be active for the World Cup games:

460.1, 858-860.2625, 858-860.9625

In addition the NJ State Police trunked system and Bergen County frequencies should also be active with World Cup comms.

S> that it is computer controlled. Do you get any interference from
the

Its not 'computer controlled', only programmable via computer. Once
you've programmed it, you disconnect the computer.

BTW, its not a really bad scanner, just not a good one. 800 mhz
reception is very poor, and adjacent channel rejection is also poor.
Its also extremely vulnerable to intermod.

S> If you think this radio stinks, what
S> others that are computer controlled are good. I believe that the

The Icom R7000/7100's are probably the best computer controlled
scanners, but expensive. There are several AOR models that allow
computer control also.

I believe that there were SEVERAL violations of MANY laws yesterday.

There were MANY violations of the UNIFORM CODE 705. Isn't that what media is all about though? ..Do not divulge what you hear to anyone who is not a party to it.. ?? How should we interpret this law? Obviously the media circus choked on this one.

I've got a copy of the OJ APB that went out.. but technically I can't let anyone listen to it because its against the law. Right?

What are you looking for? If a scanner, it's hard to beat the PRO-2006.
Many people on the net more knowledgeable than I have called it the best
scanner available. If you want a dual-band tranceiver with lots of
extended RX that is particularly strong in certain 800MHz frequencies . . .
I've never heard anyone say that there was anything better than the
Standard C558A.

> over these matters, ONLY the FCC does.
> Read Part 97, its in there.

Yes, but...

The local police CAN still make a misdemeanor arrest for aggravated harassment. The statutes view annoying radio calls the same way as annoying telephone calls.

>>

<This law quoted again for my own peace of mind>

I'm a bouncer in a bar, and I have a lot of police friends.

Out of 12 of them, *none* of them knew this law.
They, when asked "If you pulled a car over and saw a scanner,
which was turned on, with active local/state police frequencies,
what would you do?"

All of them responded along these lines:

(1) It's illegal
(2) confiscate the scanner
(3) ticket the driver
(4) arrest the driver
(5) warn the driver
etc etc etc yadda yadda.

I had to pull out a copy of the law from the "Good Book of Law",
and show them. None of them knew this. One is a *captain* of
a department. Since I'm friends, I couldn't resist shoving a
"Ever hear of a lawsuit for false arrest?" in their faces.
They read the law. It took them several minutes to understand it.
Even they thought you needed a ham license AND a permit.
But, at the least, they didn't know a non-cop/non-emergency personnell
were able to scan mobile. I jabbed another "faith in the public
servants" line.

It's scary. Get some zealous cop who thinks they're right,
and they will haul your ass in if you stand there and tell 'em

they're wrong. So, ditto to what a previous ham said:
Carry a copy of your license at ALL times, a copy of the LAW,
and if they're damned determiend to confiscate your equipment,
let 'em. Sue 'em later.

5242. O.J. chase and Cell phone

Newsgroup: rec.radio.scanner
Date: 1994-06-18 21:34:25 UTC
From: stevenp@gibeah.connected.com
Message-ID: <2tvp91$6dh@gibeah.connected.com>
Source record: 272832

Interesting bits from the O.J. Simpson Chase:

They were able to locate him because he used his Cell phone and they tracked him down to the Cell Site, and then to the block he was on.

Then he was followed onto I-5 where the "chase" (mass tailing?) was started. At that point he called 911 and told them he planned to shot himself unless he was allowed to go talk to his mother.

The most interesting part was the news media following him in the choppers. They were monitoring the Cell Phone band and found his call and the guy announced on the air what he heard and how he heard it!

Seems to me that he should be brought up on charges. If we can't listen why should he be allowed to?

5243. Question : Possible to ma

Subject: Question : Possible to make a scanner ??

To:9406161033.aa05645@csam.my

LFH>Sorry if this is a stupid question. I am new and very interested in scanner
LFH>I was just wondering if it is possible to assemble/"make" a scanner
LFH>from scratch - I mean going to the electrical shop to buy those transistors
LFH>diodes, etc and assemble it up.

Lee, sure it is possible! Find someone who has one, pop it open and decide
for yourself. The technology involved, the sophisticated test equipment, not
to mention the electronic knowledge needed, is way beyond the average home-brew
tinkerer! I assume you have the knowledge, facilities, equipment, etc. If
you have, good luck - I envy you!

Does anyone have any frequencies for this area? I have most of the
frequencies for Frankfurt Airport (FRA) but am also interested in others.
Please email any responses.

Thanks,

Marc Wollemborg

Wrong, a person can listen to the tape and hear the same first hand
information you taped from the scanner. You are not attempting to
profit from it, therefore since you are not "interpreting it" for
someone and they are hearing the same info from the same source you
did -- no law broken.

Jerry Smith (Jerry.Smith@f747.n115.z1.fidonet.org) wrote:
: Steven...
: When Uniden was getting ready to ship this unit out, they discovered
: alot of problems. One was the presence of too many birdies. Uniden
: re-designed the chip. At this point, the Telecommunications law that made
: it illegal to manufacture scanners with cellular capability after April
: 1992 was passed. With this in mind, Uniden re-designed the chip and
: decided to get a head start in complying with the Cellular Telecom law.

: So that's why no mods have ever been figured out for the 8500 for
: cellular reception. It can't be done.

While I appreciate your post, the point I am making is the sale of these units from other countries is legal. Therefore, if they were to attempt to sell this unit, for example in the U.K, where it is legal to buy a full coverage unit, they would not stand a chance against the other models without the limitation.

Therefore, I must assume they would have an export only version without the limitation. Export only due to U.S. law. But, U.S. law does not affect the sale of the chips without the restriction as a replacement part or as a raw material. Therefore, if they wanted a prayer of an overseas market against the other scanners without the limitation, they would need two types of CPUs, one locked out and one available. I am attempting to find out just how hard it is to (1) obtain the part [ie price, number, address, phone, etc] and (2) how hard to replace it by a [2a] experienced person or [2b] some mod experience in the past. I suspect it can be done. Not many appear to be looking at this side of the coin. I am -- because if there is a market, I may see a spare parts business possbility on the horizon... Send check or money order to ... specify which unit you need an unblocked cpu for ... etc.

I do not think I am dreaming, and the FCC funding bill passed by Bush very CLEARLY does NOT COVER this type of approach. On the other hand, I could stand to profit to some small amount.

I am not kidding... and would not be selling scanners, just raw materials, chips, semiconductors, not controller by the government, and not controllable by the FCC either!

A very good article in the March issue of Monitoring Times by Jack Sullivan talks about direct monitoring of some shuttle communications. His article mentions the following UHF-AM frequencies: 296.8, 259.7, and 279.0 MHz. These frequencies are used for communication between the shuttle and the astronauts while they are doing "space walks" outside the shuttle. Their transmitter output is only about 1/4 watt, so careful monitoring techniques are required. I have seen shuttle orbit tracking programs on shareware cd disk, and the data needed for the program should be available from the NASA BBS once a mission has been launched. Monitoring Times (704-837-9200) may still have some back issues. Till later, Si B.

>access the 16 blocks via keypad...The mod isn't for the faint-of-heart.

There's also a simpler version published in Bill Cheek's column in the
June 1993 Monitoring Times. The original mod from the first Scanner
Modification Handbook required the installation of a separate board
containing the new 256K DIP mount static RAM, with 24 jumper wires run
between this board and the scanner's CPU board (where the original 16K
static RAM had been located). The Monitoring Times version eliminates
the need for a separate board by using a surface mount 256K static RAM
chip, which gets soldered directly onto the CPU board right where the
original 16K chip had been (with some very minor modifications to the
CPU board). Only six wires are needed from the CPU board to the block
selection switches.

I performed this modification using miniature toggle switches in the
rear of the scanner for block selection so I wouldn't have to deal with
drilling into the front panel, and had no problems with it. Finding
a source for 256K chips in a surface mount package proved to be challenging,
but perseverence paid off. This modification is much less labor intensive
than the earlier one, but requires about the same skill level. As Brent
notes, it is not for the faint of heart.

GAT> I would appreciate advice on how to modify the RS PRO2006
scanner
GAT> to be capable of monitoring cellular channels. Does it require

Remove the top cover (2 small screws on the rear lip of the top
cover). Once off, look inside, right behind the #3 key o the keyboard.
There are 2 diodes there, cut the loops on both. One opens cellular,
the other speeds up scanning by about 20%. Replace cover, turn
scanner on, hit the up arrow button to get into search mode, select a
bank, and enter 869 and 894 as limits. Then, hit the 'reset' key on
the keypad to get the correct step rate (30K) in the cell band.

Hi Sam,

I too fondly remember the Allied Catalogs. When I first started fooling around with elctronics (vacuum tubes!) in the early 50's they were the only decent source of parts. I have a few old Allied catalogs from that period and a real gem from 1937.

regards,
Mike

Jeff,
Instead of boring everybody with a reprint of all of the mods, I'll point
you in the right direction. Simply to an anonymous ftp to oak.oakland.edu
(at Oakland University in suburban Detroit). The path to follow is:
pub/hamradio/mods/tandy. You'll find ALL of the mods you ever wanted for
your scanner and hundreds of others, too. Hope this helps. It sure
helped me when I got it.

I was watching CNN Friday night and one think stuck in my mind. Why
didn't any of the news teams pickup up OJ talking on his cellular
phone? I heard one TV guy say that he was listening to the police on
a hightech scanner, what ever that means :-) But if the scasnner
was so great why couldn't they pick up OJ. Was it a case of the media
using discression or was it that they just couldn't find the freq ?

BTW:) How long do you think it will be before the LA police encrypt
their radios, they must have been pissed about everything that happened.

Cellular phones have ID's that are picked up by cellular sites. The cellular
sites change as a person moves out of one site into another. The phone
company computers monitor these transitions making tracking an easy task.
No triangulation needed, just watch the site transitions...

Any cell phone will yield its general location when turned on. The phone communicates with the local cell even when not being used for a call. With the proper equipment, the cell phone could be tracked, cell to cell, to give general location info.

Message-ID: <ROSS-190692104351@lisaraip6.llnl.gov>
Source record: 272909

For those looking at the 100 channel PRO-2026 scanner (on sale now), be aware that there are two versions. The original 20-148 and the newer 20-148A.

Both can have parts of the 800 Mhz band enhanced but the newer 'A' version has some advantages. Instead of two hot wires (one power, one memory backup) permanently attached to the back of the 20-148, the 20-148A has a DC jack for a single power input and a fold down foot for desktop use. The 'A' version claims to retain memory for 14 days without power.

Currently available for $135 delivered (outside Texas) from MaryMac 800-231-3680 or U. S. Radio 800-433-7283

I've had one for about a year, and I really like it. Plus the price was right--on sale for $200 at the time I bought it. One potential problem I've heard about: many people complain about probelms with images in the 800MHz bands. (This doesn't bother me that much, because the police etc. in my area are not on 800MHz.)

**********< R E P O S T >**********

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups,

and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group

has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and

space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

>frequencies.

I use to work for the Nepean Police Service (suburb of Ottawa Canada) I can
tell you that our 10 Code was different than the one used by Ottawa... Some
are stardard like 10-4 etc... but some are very different Ottawa used
10-25 M for mental illness (10-25 sick person) Nepean used 10-86 for mental
person... If you monitor enough you will find out the more common 10-codes

10-4

Well, if *I* were the CNN reporter, I certainly wouldn't admit on TV to listeing to cellular as it's illegal. With regard to the comment that someone else made about OJ being tracked by his cellular transmissions, I *think* that you misunderstood. The *police*, apparently with cooperation from the cell service company, tracked OJ. It seems unlikely that the reporter's friend had the equipment to decode the control channel and tell where the cell was located. You may be right, but I'm guessing that you misheard.

Regards,
Neil

It's a good thing you're refrained from using that Alinco, as the
Restricted Permit only allows you to operate Commercial AM/FM radio
stations. You still need an Amateur license to use it.

On 6/20/94 following the National Anthem at Stanform Stadium Palo Alto CA, at Aprox. 12:25 PDT, four F4 phantoms of the 152 Air Recon. Squadron out of Reno NV will fly by the stadium. They will be talking to their ground control in the stadium on 126.400 AM mode. Aircraft call sign will be ARROW, ground control is Jupiter. The whole event will last only a few minutes. They will probably begin talking to ground control about 12:10 or a little later as they diverge from northbound Moffet approach to the stadium about 15 miles south of Palo Alto.

Happy monitoring...

The aircraft will be at a few thousand feet, so you should be able to hear them all over the south bay. Ground control will be up at the lip of the stadium, so people in and around Palo Alto will also be able to hear him...

I have NEVER had a scanner before but because of recent events at my
home, detroit area, have bcome very interested in getting one. I have
looked a radio shack model pro-2032 but having NO electronic exprience I
found that the mod would be very hard for me to do! (cutting wire is
different from unsodering a part and replacing it!) I asked about the
pro-2004 but the man had nothing to say.
What I am after is if there is any place still offering the
pro-2004 made before the Apirl deadline. Any numbers would help or
comments on the modification for the pro-3032 (is it not THAT hard) Also
when I buy it how do I tell its before the Apirl deadline?
You can either post or email, any other info is greatly wanted
(other better models)

You mean the PRO-2006. It may be too late, but try Grove at 800/438-8155, Marymac at 800/231-3680 and every RS in your area. You may luck out if you keep plugging. There is a company by the name of Cellular Security Group 508/281-8892 that modifies most modifiable scanners for a flat rate of $40, including return postage--a great service for the desoldering impaired who own PRO-43's. *Anyone* can modify a 2006; there is no need to pay anyone to perform that modification.

The 2006 is a nice scanner, but if you're a portable kind of person you might consider the PRO-43. I haven't seen any 2006's on the shelves locally, but I have seen 43's,

No US dealer carries this scanner to my knowledge. ACE Communications tried to get FCC approval for a cell-blocked version but failed. (This did not stop them from tkaing orders for same, with indefinite waiting period).

EDCO (EEB) has a cell-blocked AR8000 in the lab. They may distribute it here this fall; if the scanner proves to be as good as it looks on paper, you might pass by the MVT-7100 anyway.

Ok, here is the problem. While using the tape output to record, there is a pulse about every 10 seconds or so while scanning. Through the speaker you can hear it but you have to turn the volume up full and still then it's barely audible. Through the tape output the amplitude is such that it trashes any attempt to use a vox tape recorder. Once the squelch is broken, it isn't there. Now that I think about, it happens with my pro-34 as well while using the ear jack. What's wrong besides the equipment being Radio Shack?? The only mod I've performed so far has been the cellular restoration. Any ideas or hints will be appreciated.

Thanks,
Bill Koechig, N8PKA

My advise is not to worry about how difficult the mod is. Most all mods
are difficult on surface mount boards. Buy the scanner you like, print
out the mods, go visit your local radio/TV repair shop and pay the
$20 bucks to move a few diodes or change a jumper. You don't have
to tell the technician what the mod is for. Just say .."please
move diode d3 to d5..." I want to change the performance a little.

If you don't have the equipment and experience is microelectronics and
surface mount..DO NOT do the mod yourself. Help your local economy
and make a new friend at the local repair shop. You won't regret it!

I read the same thing in the Ottawa Citizen on Friday 17, June 1994 it
was pointed out in the article that the use of scanners in Canada IS
LEGAL... so they are talking about banning a legal product... More of
the lobbying of the cell phone companies... If they pointed out that
the cell phones are radios, and can be monitored by anyone with a
scanner (or even an older TV with channels 72 -83) then maybe a few
people would would be a little bit more careful in what they say on the air.
A funny thing happened to my PRO-2005 scanner, a diode somehow fell out
;-> and all the cell phones started to come through

5276. Help requested on handheld purchase

Newsgroup: rec.radio.scanner
Date: 1994-06-19 23:07:26 UTC
From: mud@leland.Stanford.EDU
Message-ID: <2u2j3e$23d@nntp2.Stanford.EDU>
Source record: 272924
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

Hi. I have been considering buying a scanner recently. In the (near?)
future I will also probably see about becoming amateur licensed...
As such, I was hoping to solicit opinions on a couple of
scanner(/transceiver) handheld units that seem to offer the features
I want:

- ICOM 2SRA (2M transceiver, 50-900Mhz receiver)
Sounds like a great combination for my needs, but the local
(note that I live in Vancouver, British Columbia) radio
outlets say that at best it is mediocre as a transceiver and
as a scanner...

- Yaesu FT-530 (2M transceiver & 440Mhz transceiver)
Reccomended to me by a local radio outlet as being a good
transceiver, and it can be modified to receive 108-180Mhz,
300-500Mhz, and 800-9??Mhz.
I'd really like to hear from anyone who owns this unit
about how useful it is as a scanner after being modified.

- Uniden Bearcat 2500XLT (wide coverage receiver)
Sounds like the best wide coverage scanner available for the
price. Local radio outfits reccomend it, but sell it for too
much. The file in the hamradio archive that describes how to
restore cellular reception for this unit warns that there may
be model(s) that are different from the one described by that
modification file. Has anyone actually seen one that cannot be
modified to restore cellular reception?

I'm told that the AOR scanners have too many intermod problems to be
useable in my local area. The Yupiteru MVT7100 sounds nice, but is too
expensive for me for just a scanner. The "Trident"(/Camnis) models that
Ace advertises sound nice featurewise, but I'm concerned that I would
not be able to restore cellular reception on any of them (again, though
this is posted from Stanford, I live in British Columbia).

Currently I'm leaning towards the Yaesu FT-530, as long as I can be
reassured that it will make a fairly decent scanner in it's extended
receive frequency ranges.

Thanks in advance for any help in making my decision!

[Richard Postgate]

Are there two models? One with Hyperscan and one without?

If so, what's the expected price difference between the two?

If not...*blush*...my mistake.

3039 7300 61 18% 63 0.2 8% 0.01 0.1% aus.radio

Several positive trends continue this month. Readership is up dramatically in all active newsgroups (closely following Usenet's predicted exponential growth patterns). This month, rec.radio.shortwave trades places with rec.radio.amateur.misc as the the number-one rec.radio.* newsgroup. Other newsgroups with extremely strong showings are rec.radio.swap and rec.radio.amateur.policy (meeting their respective goals of keeping for-sale messages and extended legal debate out of the main discussion newsgroup). Currently, rec.radio.amateur.equipment leads the other new rec.radio.amateur newsgroups by a slight margin, although all are roughly at the same order of magnitude. The recently-created rec.radio.scanner is slowly gaining in readership as well, its propagation having surpassed alt.radio.scanner, which it supersedes. Recently, a cancel message was sent out for alt.radio.scanner (which wasn't superseded by a forged rmgroup this time) and appears to have been obeyed at many sites (Although clearly many sites and readers consider it to be an active newsgroup according to its readership statistics, underscoring the point that alt.* newsgroups, even those superseded by valid mainline newsgroups, are very hard to remove, and those proposing new newsgroups should carefully consider the hazards of potentially junking up the newsgroup namespace with trial alt.* groups).

It is expected that the newly-created newsgroups will continue to grow in readership like previously-created newsgroups such as rec.radio.info and settle out at about 60-70% propagation. If these new radio-related newsgroups still haven't reached your site, please ask your news administrator to create them (refer him/her to the new newsgroup announcements by Dave Lawrence in news.announce.newgroups or the messages posted to the new newsgroups piling up in "junk" :-). Especially point out to him/her that cost/per-reader/per-month is significantly down in all newsgroups.

The defunct newsgroup rec.radio.amateur.packet has been rmgrouped as of September 21st, 1993, and is no longer connected to the PACKET-RADIO mailing list. Netters interested in packet-radio discussion should use rec.radio.amateur.digital.misc and the HAM-DIGITAL mailing list. Propagation and readership continues to drop in the old newsgroup, which is currently in last place among all the rec.radio newsgroups. If this newsgroup still appears at your site, ask your news administrator to rmgroup it.

Note also that the defunct rec.ham-radio hierarchy reappears this month. If the newsgroups are still active at your site, please try to persuade your your news administrators to delete them as these groups have been rendered obsolete (for well over 3 years now) by the rec.radio.amateur hierarchy.

The trouble is that you are using "line" level output of the 2006 to
drive a mic input on the recorder. Line level is *much* higher than
mic level. You need an attenuating cable. Radio Shack carries one
I believe.

Hey there!

I hope someone can help me out. I am going to Italy and
Israel this summer and I always like to be up on what's going on.
If anyone has frequencies for these two countries, I would be
grateful if you could send them to me at:
an648@freenet.carleton.ca
Thanks in advance-

Bob Beresh

P.S.
If anyone has a recent Michigan list, it always helps.

Thanks Again.

Since (according to most reviewers without financial interest) AR has yet to
sell *any* scanner that's as good as it looks on paper, I won't hold my breath
for this one.

I use my 2006 with a VOX recorder on a regular basis without ever having had
the problem you describe. If that were all there were to it, I might think you
have a defective unit. But with it happening on the 34 as well, I have to ask
if you've ruled out RFI. Can you borrow another unit or two to see if they
experience the same problem at your location? Does it happen simultaneously
for both units when they're both running?

I don't think you can search between limits with this scanner. It's
either up or down.

5286. Pro-46 for sale w/ cell mod

Newsgroup: rec.radio.scanner
Date: 1994-06-20 03:46:01 UTC
From: merlin@ripco.com
Message-ID: <CroFsp.8vB@rci.ripco.com>
Source record: 272787

Radio Shack PRO-46
Hand-held, 5.875x2.625x1.5
Box and manuals
100 channels in 10 banks
10-channel monitor bank
Weather key
29-54, 108-136.975, 137-174, 406-512. 806-956

The cellular restoration mod has been preformed so you do got full 800mhz coverage. I'm looking to upgrade to a PRO-2006, so if you've got one and want to downgrade to a hand-held or got a spare you want to trade, or if you just have one for sale, I'm interested.

Best offer takes it.

From: x90diget@wmich.edu
Message-ID: <1994Jun20.045347.18947@wmichgw>
Source record: 272810

I went to the Pontiac Silverdome last Saturday for the World Cup soccer game and wished I had some freq. Just about everybody working there had some sort of radio.

I am going to Soldier Field in Chicago on Sunday (26th). Does anybody have freq. for 1) stadium security, 2) TV or radio stations that might be broadcasting from the field, 3) Any other freq. that might be of interest?

Also, I assume that Chicago police are on a 800 trunked system. Is that correct? If so does anybody have the frequencies for them?

Since I am rather new scanning, What bands should I search on if I don't get any response? Any help would be appreciated.

I'm sure the police and PacTel (Airtouch) were on him fast. Tracking a cell-phone might not even be considered 'tapping' a phone line if they claim they did not listen to the conversation. Maybe OJ will use this in court. It's easy to trick that DA, as we've all seen in the past. As for tracking a cell phone, I have a PacTel(Airtouch) Teletrac in my car which uses the same cell sites as the phones. Pac tel can tell me where my car is down to the cross streets in less than a minute when I call them. They definitely know what they're doing!

5294. ANTENNA (HORIZ VS VERTICAL)

Newsgroup: rec.radio.scanner
Date: 1994-06-20 11:00:11 UTC
From: jeff.wright@chrysalis.org
Message-ID: <9406201100.0FGH001@chrysalis.org>
Source record: 272853

Greetings!!!

I have a question about magnetic mount antennas...

I had a scanner antenna mounted vertically on the roof of my truck,
but got tired of hearing it hit the garage door as I went in and out.

I mounted the antenna behind the seat of the truck, horizontally so that
it is sticking to the side of the cab (and looking out the rear window).

The question is does mounting the antenna horizontally greatly reduce
the number of signals I will see? I seem to remember something from my
college physics classes about waves and how they travel...either vertically
or horizontally oriented.

Also, does the metal in the cab of the truck knock out a lot of signals?
I wouldn't think so...the cab is enclosed on all four sides by glass.

Any thoughts are appreciated.

jeff.wright@chrysalis.org

: Please e-mail me if you know of a source in the United States that
: still sells the full-coverage Icom R-7100. Thank you heartily.
: Sincerely,

Does anyone knew if the R-7100 has a D.C. jack for 13.8v (mobile
type power)?

If so, you may be better off checking an overseas supplier and only
purchase the (not banned) 13.8v D.C. to 120v A.C. mains adapter in the U.S.
This would permit 800-900mhz reception, uninterrupted.

In this frequency range, this is called ducting (or troposheric ducting). It is different from "skip" or sporadic E, in that the signals are not bouncing off the ionosphere but rather "hug" the ground because of realtive temperatures and other factors.

In talking to the Icom folks at HAM-COM two weeks ago, they indicated that they were all sold. Icom shipped them all out to dealers several months ago. Tucker Electronics in Dallas bought a boatload but has long since sold them all. Several used equipment dealers (at HAM-COM) stated they they were selling above list on the used market. Same for the Yupi MVT-7100.

Does a Restricted Radiotelehone Operator Permit really allow you to operate
a Commercial radio station? I got mine when I was taking flying lessons -
at the time, it was necessary to operate an air band two-way for some
reason (don't remember why).

I always loved the 'this allows you to operate any radio which may be operated
by someone holding this' language.

Cheers,

: control channel and tell where the cell was located. You may be right,
: but I'm guessing that you misheard.

I just heard an interview on the radio with a representitive from the
"umbrella group" that represents the cellular industry. He explained
how position tracking is done, and stated that call content is not
involved. A court order is needed to track position, but another court
order, presumably one more difficult to get, is needed to intercept the
conversation. The location tracking basically locates which cell site
the call is being picked up by plus monitoring of actual signal strength
which usually can get to within a mile of the location.

On another note, a Buffalo TV channel was airing thier own coverage instead
of the network feed and they had a reporter in LA by phone (pictures were
from various sources). The reporter had a scanner and was holding the phone
to the scanner's speaker when things came across. Now what was that law
about retransmitting scanner material....

Carnuba wax. Most materials you try will unacceptably reduce the required
capacitance coupling of the magmount to the vehicle body. This is what
gives the antenna it's necessary groundplane. A good heavy coat of carnuba
wax will prevent the bare *clean* magmount from scratching your car without
greatly affecting the capacitive coupling of the base to the vehicle.

Curious. Two questions on the topic:

Is it legal for the media to tape audio from polics freqs and play it for
the public, after the event occurred?

Is it legal for someone to tape audio from a freq, say a distress call or
something, and sell the tape to the media?

5312. Bearcat 8500XLT

Newsgroup: rec.radio.scanner
Date: 1994-06-20 16:51:37 UTC
From: GRZYB@vaxa.cis.uwosh.edu
Message-ID: <01HDRI04757U0091KZ@vaxa.cis.uwosh.edu>
Source record: 272806

Date sent: 20-JUN-1994 11:29:11

I recently purchased a Bearcat 8500XLT from Scanner World. The unit suffered from interference all over the civil aviation band. Another contributor to this group guessed that it was intermod--it sounds like the interference I used to get on AM radio when running power tools. Scanner World replaced the unit, but the problem was heard with the replacement as well, so I'm returning it for a refund. What a shame! The 8500 has many features I really like, and that you won't find on many other units (e.g., the ability to switch a taperecorder, an alphanumeric display, a count function, etc.). The only dumb thing on it was the fact that the delay was global. This could have been THE great hobbyist scanner of the present.

I have a PRO2006 (which is much better in the basics than any scanner I've owned), but I still would like the count function and the tape recorder control, so I'm sending my old BC300 back to Uniden to see if it can be repaired. Does anyone else have experience with the 8500? Is it indeed particularly susceptible to the kind of interference I heard?

BTW, I also have a PRO32, a PRO37, and a PRO43. They keep getting more capable, but the one thing I've noticed is a decline in audio quality! My recording company (which produces steam locomotive and aviation sound recordings) relies very heavily on these scanners. We were reluctant to try Bearcat again after using Radio Shacks alone for the last decade or so. Our reluctance seems to have been justified.

Anyone who has advice regarding civil and military aviation transmissions, please contact me. And if anyone will be attending the EAA convention in Oshkosh this year (the world's largest aviation event), feel free to ask me for a list of UHF freqs that the EAA itself uses.

One thing we have heard for sometime is that calling 911 from a cell phone can be problematic if you cannot get your message through verbally. Most 911 systems have a call-trace feature where the operator has a location description on their screen before they even talk to the caller, so if something has happened to the caller, they can still dispatch a unit to the location. With cell calls, this is not possible because the phone number is really a number that the cell phone carrier owns and the number's "address" is that of the location where the cell network connects to the "wired" phone system.

Locating a cell call is possible, but it requires first a court order. The cell network must keep track of what cell site is communicating with the phone and this is the first step in locating the call. Cell sites are geographically smaller where the density of cell phones is greater, such as in a city. The next step that will pinpoint the location to within a few miles, is to check the signal strength. The final step is actual visual sighting (ie: looking for the caller on the road!).

Did CNN tape the call off of the cell frequencies, or did they acquire a copy
of the 911 tape from the LAPD?

It does seem strange when the press does all these quasi-legal things under
"freedom of the press," yet we're not allowed to listen to their remote links.

I'd bet they got their recording from the law enforcement
authorities. Are all 911 calls recorded for the records? Check out
the "911" TV shows that always have a recording of the original
conversation.

This must have been scanner heaven! You can bet that my scanner
would have been searching through the "business band" of 800Mhz. :)

Hi all,

I am considering adding a Beartracker to my collection of mobile scanners as I plan to do some major driving in Washington, Oregon, California, and Nevada this summer. I live in Vancouver, BC. I am hoping the Beartracker can do a few things for me (1) Act as claimed regarding its ability to locate police cars and (2) give me access to the aforementioned states, police, highway patrol and DOT frequencies without having to reprogram my main scanner (which is full of Canadian police, emerg, and highways freq.'s).

Does it do the above (2) things well? Could someone who has used this thing actually let me know how function (1) works? I understand it detects the mobile extender freq. but what does it do when it finds it? (ie. does it blare an alarm, flash a light, does it blare the alarm for the whole duration it is in range of the mobile extender, etc.) In other words how annoying is it and how ergonimically friendly is it (ie. am I going to ignore it after a few days because I find it annoyingly useless?).

Other items:
Will it be of any good whatsoever within Canada?
Will it's radar detection circuitry interfere with my Valentine1? (If so, any conjecture on how hard it will be to disable this circuitry?)
How much should I pay?

Thanks for any and all responses...

Rubber boots are available. Or make a disk of thin rubber, I cut one
from an old inner tube which I scrounged from a local garage for the
sum of $0.00. Make sure that the magnet is strong enough to grip
securely through the rubber though. I found that the rubber made no
measurable difference to the SWR or signal from the aerial, but YMMV.

The tape you mention was from the police end of the phone. The call was
made to 911 and recorded as normal practice. It's a public record.

Yeah, I saw it too..

I don't think they were airing the call recorded by cellular. Doing that
would be illigal. Since all 911 calls are recorded, I suppose they bought
the 911 call, similar to those Rescue 911 type shows where they reinact
and broadcast the actual 911 call.

Bob-
FYI, you'd not want to get caught bringing a scanner into Israel.
Penalties aren't light, and the fines aren't low. You'd be taking a
big, no, *very big* chance by just trying to bring one in, in your
luggage. Having been in the police there, I definitely wouldn't recommend
it to you.

Excuse me for interjecting, but isn't anybody with a scanner able to track siganl strenght without a court order? A simple signal strength meter and a Yagi will do wonders, and tell you pretty well where the source of the transmission is coming from. And No, it wouldn't be illegal to track the signal strength, because all you have to do is monitor the presence of a radio frequency, not the content or modulation of that frequency. In other words, turn down your volume and track away. Now as to the legalities of using that information to monitor the conversation or to present as evidence in court for commision of a crime, I don't know. But the police might be able to simply monitor the presence of the signal for solely determining the location of a subject. This brings to mind the discussion a few months ago about the technicalites of using a frequency counter to find the frequency a cell phone is operating on.

|> -jw

Well, If the call was recorded by lawful authorities who had
the proper warrents...

They can probably distribute it at will.

Another thought: 911 calls are always taped and are probably
part of the public record for legal purposes. They didn't
have to monitor the cell transmission at all.

The OJ story represents a new low (IMO) in telejournalism. The
whole circus was created by the media who couldn't keep their
mouths shut long enough for the cops to apprehend the suspect.

It's pure luck that no one was hurt or killed in the incident,
what with all the bizarre driving, dozens of helicopters flying
about, crowds, etc.

Yes, the public has the right to know, but do we have the right
to know in real time when that knowlege may endanger others?

At least Scanner users don't chase the ambulances, etc.

Food for thought...

George

No, the device is not illegal. The public utilities commission (I've forgotten what CA calls it) that regulates the local phone companies made California an undesirable place to offer such a service. For this reason, PAC*BELL doesn't offer Caller ID in CA. They decided that it wouldn't be worth it.

> 'CALL RETURN', but it won't tell you the number. The local Radio
> Shack guy said that Radio Shacks in other states (he didn't specify
> which states) sell such a device.
> Can anyone tell me which states (hopefully one that neighbors CA) sell
> something like this? Approx. cost? Works with any phone system? Any
> other details.

As far as I know, the box itself isn't illegal to buy or sell, there is just no way to use it in California. This is probably why no one sells it there. The box works by decoding a special signal that the phone company's central office sends between (I think) the first and second ring. In states that have Caller ID, this only works for people who subscribe to the service and are sent that special signal.

A lot of modems now have the ability to decode caller id signals, but again, you have to subscribe to it and your phone co has to offer it.

5337. Legal rights to see FCC license?

Newsgroup: rec.radio.scanner
Date: 1994-06-20 22:52:26 UTC
From: Sherrod.Munday@launchpad.unc.edu
Message-ID: <2u56ja$7ee@samba.oit.unc.edu>
Source record: 272842

Here's a question for the more knowledgable of you out there:

What are the rights of the citizens to walk into a police station and ask to see the FCC frequency licenses issued to the station? I'm under the impression that the Freedom of access to information act (or whatever it's called) gives citizens the rights to public documents, and I'm also under the impression that FCC licenses must be displayed in a prominant location visible to people who may enter the building.

The few times I've tried asking the local PD chiefs this, they've given me the cold shoulder and said they're not allowed to reveal that information, and "Why don't you just go down the road to Rat Shack and look at their books?" type comments. I've had better success talking to local cops sitting around in their cruisers waiting for a call, who like the fact that citizens are interested in their work, etc.

Any legal documents you can point me to would be nice, and If I could quote the pertinant information to the local PD force, they might be a little more cooperative.

No,
There are other Radiotelephone permits for operating a commercial station.
The Restricted Radiotelephone was use for Aircraft radios (by pilots), marine
band and these type of services. The requirement for Pilots to have one to
operate an aircraft radio has be dropped. I don't know about the other services.

Bob-
FYI, you'd not want to get caught bringing a scanner into Israel.
Penalties aren't light, and the fines aren't low. You'd be taking a
big, no, *very big* chance by just trying to bring one in, in your
luggage. Having been in the police there, I definitely wouldn't recommend
it to you.

I'd be happy to sell you my PRO-2004 with AIE TCF-4 tone finder/decoder attached. The scanner also has 6,400 channels, LED center tune and S-meter indicators. Price is $400 - I ship.

Message-ID: <772269483.AA06781@rochgte.fidonet.org>
Source record: 272675

Announcing the creation of a new amateur radio net for scanner and shortwave enthusiasts. This net serves the western NY state area and the Finger Lakes Region on all of the frequencies listed below.

Net Manager and NCS is me, NF2G.

Rochester, NY 442.800 WNY SWL & Scanner Net Monday 20:00 ET
" 146.925 " " " " "
" 224.580 " " " " "
" 53.330 " " " " "
Mendon, NY 444.700 " " " " "
S Bristol, NY 442.900 " " " " "

These repeaters, comprising a system known locally as the Megaplex, are normally in carrier squelch mode. If any are placed into CTCSS mode due to local noise conditions, try using 110.9 Hz for access.

==========

The Finger Lakes Alert Group, a new scanner club serving the Finger Lakes Region, now has an Email address on the Internet. Messages to FLAG can be addressed to:

FLAG@rochgte.fidonet.org

5351. More FCC license info (on disk)

Newsgroup: rec.radio.scanner
Date: 1994-06-21 03:13:15 UTC
From: Sherrod.Munday@launchpad.unc.edu
Message-ID: <2u5lsb$g7q@samba.oit.unc.edu>
Source record: 272852

Picked up a flyer from work the other day that was being thrown out...
Thought some of you out there might like to know about it.

Action Data Processing inc.
817 Silver Spring Avenue
Silver Spring, Maryland 20910
(301) 587-0558 (800) 526-8270

(I'll try to quote the brochure as best as I can)

Two Way Radio Licenses Data
-Action Data Processing maintains a data base of all FCC two-way radio
licenses, which is taken directly from ythe FCC files.
-All services for state and local government, as well as services for
private industry are included, from the lowest frequency range to the
highest frequency range.
-Listings of all licenses within a state, county, or geographic area are
available.

First type of order: By state.
Here they list all 50 states, some broken into subregions, and the prices
for the various listings offered. They have 1)computer printouts and
2)Magnetic tape or Diskette (high density), and in each of 1) and 2) they
have three sorts of information: a)Under 800MHz & over 935MHz, b)800-935MHz,
and c)Combined (whole frequency range).

Second type of order: By county.
-Select any county or series, ecen if they cross state borders.
-County Data inclueds all licenses and services within your selected area.

Cost for County Selection
# of Counties Computer Listing Diskette
1-5 $75.00 $125.00
6-10 130.00 190.00
11-15 180.00 260.00
If more than 15 Counties: consider radius search below.

Thrid type of order: By geographic Area.
-Select either a 50 mile, 75 mile, or 100 mile radius of a selected city
or geographic area (lat/long).
-All licenses and services are included.

Cost for geographic Radius
Radius Computer listing Diskette
50 mi 140.00 190.00
75 mi 210.00 290.00
100 mi 290.00 390.00

Description of Files shown on previous pages:
Listings are available either in Short Record or Long Record formats.

Short Record
-Frequency -Expiration Date of the License -Lat/Long of transmitter
-License Name -Type -xmitter State County and City
-Call Sign -Number of Mobiles
-Service -Zip Code

Long Record: Everything in Short Record plus...
-License address, city, state -Phone number -Emission -Azimuth
-Antenna Height -Polarization -ERP
-Elevation of antenna -Power -Mobile Totals by Mobile type

The Long Record is double the cost of the prices listed on previous pages.

Services Included:
AA AC AD AF AG AR AX BA BF BI
BS BT CA CC CD CF CG CI CL CM
....etc... You name it, it's there.

Cost: The prices above are COD prices. Pre-pay and take 10% discount.
S/H: UPS Ground: $9.00
UPS blue: $9.00, plus 4% of order
UPS red: $$10.00, plus 10% of order

The disk prices are based on High-density disks. The format is ASCII,
Fixed Fields. Operating Software is not provided. All diskettes will be
3.5" unless specified. All sales final. Prices subject to change without
notification. Call 1-800-526-8270 for a mailing list price quote.

[end brochure paraphrasing/quoting]

The reason I didn't copy the state prices is that there are 6 for each
state, and I'm not typing in that many. But an idea is that VA, with
~52000 records and 8 HD disks, costs are as follows:

Computer listing Diskette or Magnetic Tape
Under 800&over 935 800-935 Comb. Under 800&>935 800-935 Combined
$148 $74 $184 $278 $154 $334

Short record is 118 characers/record, and Long record is 241 char/record.
Figure on about double the number of disks for the long record.

This service provided to you in the interests of the public good. ;-)

BTW, if anyone is interested in chipping in to get the state of Virginia,
e-mail me and let's talk details. The more, the better (read, CHEAPER)
for everyone...

Just wondering if someone can help me identify this frequency .. 154.7550 Mhz. I am in Richmond HIll, Ontario and I was just listening to my scanner early this evening while talking on the phone. Well I got my friend to verify its existance and he heard it too (he's in Burlington, Ontario).. Well I looked in the haruteq book and the only listing for that freq is somewhere up in Salt Ste Marie, Ontario... I have a Radio Shack Pro 43 and my friend in Burling has a Bearcat 2500 ... Anyone out there know what this is. Oh yeah in both cities we heard it loud and clear...

Matthew

5356. Re: Legal rights to see FCC license?

Message-ID: <1994Jun21.063830.21723@hpcvaac.cv.hp.com>
Source record: 272861

Sherrod.Munday@launchpad.unc.edu (Sherrod Munday) writes:
:
: What are the rights of the citizens to walk into a police station and ask
: to see the FCC frequency licenses issued to the station? I'm under the
: impression that the Freedom of access to information act (or whatever it's
: called) gives citizens the rights to public documents, and I'm also under

I don't know about that. However, you can obtain the frequencies that were assigned to the police department from the FCC. Of course, you will have to pay for that privilege.

: the impression that FCC licenses must be displayed in a prominant location
: visible to people who may enter the building.

Nope. The license must be displayed on close proximity to the transmitter. It may not be anywhere close to the police station, and usually isn't. It will be at the top of the building or hill where the antenna is located. It must be available for inspection by the FCC, on demand - but there is no requirement to make it available to the public.

: The few times I've tried asking the local PD chiefs this, they've given me
: the cold shoulder and said they're not allowed to reveal that information,
: and "Why don't you just go down the road to Rat Shack and look at their
: books?" type comments. I've had better success talking to local cops
: sitting around in their cruisers waiting for a call, who like the fact
: that citizens are interested in their work, etc.

The chiefs are either lying, or are misinformed. Take your pick - the odds are about 50/50. That is, assuming they have the slightest idea of even the band on which the radios operate.

: Any legal documents you can point me to would be nice, and If I could
: quote the pertinant information to the local PD force, they might be a
: little more cooperative.

There is no law requiring them to tell you the frequencies. On the other hand, you might ask them what they have to hide, if they are unwilling to disclose the frequencies used.

Try the internal disk from a floppy disk. Sacrifice an
old 3.5 or 5 1/4" disk by breaking it open and removing the
magnetic medium. Like a previous poster suggested, a coat of
carnuba wax (applied and not removed) at the site of the mount
is a good idea.

>The question is does mounting the antenna horizontally greatly reduce
>the number of signals I will see? I seem to remember something from my
>college physics classes about waves and how they travel...either vertically
>or horizontally oriented.

It won't reduce the number of signals, just the signal strength. However most
local signals you may monitor are strong enough where this sholdn't matter.
The weak signals will probably be undetectable now.

>Also, does the metal in the cab of the truck knock out a lot of signals?
>I wouldn't think so...the cab is enclosed on all four sides by glass.

Yes it will. I once stuck a mag mount vertically behind the seat of my
pick-up and could hardly receive anything (it was mounted below the rear
window). Mounted near the window like yours will work ok, but you may get
some directional effects as the car blocks some signals from certain
directions.

Phyllis, this is probably due, partially, to the inversion layer. The hot weather you folks have been getting back there is another factor. What you might have been hearing was VHF ducting which could be considered a form of skip. Don't quote me on this, though, as I'm no expert in that field. Happy Monitoring...Brian.

There are business frequencies that airlines use also:
460.650 to 460.875 in 25KHz steps (and also 465.650 to 465.875)

Sherrod Munday (Sherrod.Munday@launchpad.unc.edu) wrote:

: Excuse me for interjecting, but isn't anybody with a scanner able to track
: siganl strenght without a court order?

Yes, but you couldn't go to the cell company and get them to do it for you,
as the police did. :-)

Plus, they can also narrow it down to the cell site first, and know when
it switches cell sites, and know what frequency it is on on the next site
instantly instead of having to search for it....

The bottom line is, you can do it yourself, but by getting a court order,
the cell company can do it more efficiently and quickly.

From: richardc@Emass.Esy.COM
Message-ID: <9406211410.AA00654@tigger.esy.com>
Source record: 272867

Does anyone know where I can find a simple way to interface my Realistic PRO 2006 scanner to the RS-232 port on my IBM PC?

I'd prefer to find a do-it-yourself method (I could write the software myself). But a commercial solution would be okay.

I've seen vague references to an HB-232, but can't find who makes it or how much it costs. I did finally find an ad for the OptScan 456, which does this, but it has alot of extras I'm not sure I can afford to get.

Thanks in advance,
==========

>--

The FAR's (91.21) specifically allow:
Portable voice recorders
Hearing aids
Heart pacemakers (The FAA is being nice here!)
Electric Shavers

or

Any other portable electronic device that the operator of the aircraft
has determined will not cause interference with the navigation or
communication system of the aircraft on which it is to be used.

The FAR's go on to say that determination shall be made by the operator of
the aircraft (in this case United Airlines). (Technically the United pilot
could not make this determination.)

This is the high quality paste wax used on cars before the advent
of the silicone marvels that just spray on and wipe off. It's the
old yellow wax that takes all afternoon to apply and laborously
rub off. It's still available under the Classic and Meggar labels.

>carnuba wax (applied and not removed) at the site of the mount
>is a good idea.

This is not a good idea. Placing a conductive sheet between the mount and the car body creates two capacitors in series. As the formula for series capacitance will show [C=1/(1/C1+1/C2)], this *halves* the capacitance between the antenna and the car body. A layer of non-conductive wax only reduces the capacitance by the small amount that it increases spacing, a negligible change in this case as the wax only adds a few thousanths of an inch to the spacing, which is primarily determined by the paint thickness.

The frequencies airlines use are the frequencies of the air traffic
controllers at the airport. Getting a pilot's map will show the
frequencies for the airports.

Just to let you know, when you enter the plane they'll say "use of portable
electronic or cellular equipment is prohibited..." They will allow portable
computers, gameboys, discmans, walkmans, pacemakers, etc. Radios, TVs,
cellular phones/modems, etc. are not allowed.

Yes, the 7100 can run from 13 vdc. As a matter of fact, it runs MUCH
cooler from 13vdc than from the 115vac supply. I recommend you run
from the 13vdc if you operate for extended periods.

From: r_egeland@cc.colorado.edu
Message-ID: <2u77b0$r00@lace.Colorado.EDU>
Source record: 272727

There seems to be some debate here about whether it is illegal to tape conversations heard on scanners. Fedral law (c. 1934) specifically prohibits the media or anyone else from recording any conversation not specifically intended for the receiving audience (the scanner listener). Any other actions such as playing back a recording are subsequently illegal.

As an ardent supporter of scanner rights, I favor this law. Listening to a scanner should be legal - using information from your scanner for your own benefit should not.

Don't think so. Portable computers are one of the main things they
do NOT allow. I'm pretty sure that the other things you mention are
not allowed on commercial flights...except for the pacemaker!
It all depends on the carrier. Each have a different policy.
Just ask the captain about your scanner when you board the airplane. If
you ask the flight attendant, most likely you'll get a 'no!'.
On my last trip, the captain let me use my bc200xlt. However, on the
return trip, the captain said 'no'.

Izzat so??? Please note that the Communications Act of 1934 made no reference to tape recorders, nor to "interpreting" the information, nor to making a profit. It simply says that it's illegal to "divulge" the contents of the communication to a third party. Whether you do this by oral, written, or electronic transcription is not significant.

|>
|> Sherrod

This idea would work if the cellphone of interest was the only phone using the frequency at the time. A key advantage of cellular technology is that one frequency can be used by several users at the same time. In the LA basin, having more than one user on a frequency is more the rule than the exception. The cell sites are somewhat directional and the system keeps track of what frequencies are in use (and where) to prevent intereference.

Also, cell phones can change frequencies on their own. If the phone moves from one cell to another, and the freq. in use would cause interference in the new cell, the phone automatically switches to a clear frequency.

This is good and bad. You can't easily track a cell phone with normal t-hunt techniques, but the cell-phone company can tell immediately

what cell a particular phone is in (as long as the phone is turned on).

In short, if you're on the lam, turn off the cell-phone!

: Thanks,
: Jim C.

So what will we start the bidding at? $350? $400? $425? $450?
This is a rare piece of equipment, the risk of jail time if you are
caught importing it... possibility of felony conviction...

(some of the above was said sarcastically...)

Seriously, I know I can buy one at Radio Shack right now for $399,
as I just spoke to them on the phone. No shortage, not discontinued.
The change is one of the easiest available. From mail order, I think
that drops down to $350, maybe $340. If its in mint condition, I
would suggest $325 to $340. Not a penny over $375. Now add the
Opto-456 to it and it could become twice the value...

Mike, there ARE some places in the U.S., they generally purchase a
single unit or two or three units, keep them a few weeks, use them,
and then resell them in the classifieds in the back of PopComm. That
is the only legal way they can resell them in the U.S. (using all
of the loopholes to do so). Do not expect a low price due to them
being used. It would appear to be a personal sale of used equipment.

TO: Tim Dobbins
FROM: Bob Grove

Dear Tim:
I read the posting of 27 May which was laid on my desk today and was astounded by the naivete pervayed in it. Someone up there is working overtime embarassing himself!
It IS against the law to import into or market in the United States cellular-capable scanner and converters, although there are still some folks out there doing it. Javiation, a former MT advertiser and a British firm, was warned officially by the FCC not to advertise the MVT-7100; apparently Atlantic has not yet been notified. It is not unlawful for us to accept the advertising because we are not doing the marketing.
The FCC's Form 740, which allows an individual to import up to three non-type-accepted devices for his personal use, no longer applies to cellular-capable scanners.
As of about a month ago we were unaware of any U.S. Customs inspectors who had been officially notified of the contraband, but if they recognize the package, they have the right to confiscate it.
I was amused by the reference that we might have "sold out to the FCC." The FCC is regulatory agency, directed by Congress to enact certain rules and regulations. Did you "sell out to the IRS" by paying your taxes this year?
The availability of cellular-capable scanners IS drying up! We have watched as several models have fallen out of production, replaced by non-cellular-restorable follow-ons. As the cellular- capable PRO2006s are sold out (and they're going fast!), the new, non-restorable model, indistinguishable on the outside from the former model, is filling the void--but it isn't cellular- restorable.
Say what you wish about Grove Enterprises, me, and MT, but keep it accurate, not as misinformed as what was propagated in the 27 May disservice to your newsgroup.

As a frequent United flyer and scanner enthusiast; here's what I do:

First, United has several business band frequencies; the most common being 460.675 (or thereabouts) and 460.725. There are also "company" frequencies of 129.3 and 129.5 MHz.

Probably the most fascinating frequencies would be the ground control and in-flight frequencies. For these, you won't even need a scanner, as United typically feeds all this stuff into channel 9 of their entertainment system. Be sure and ask a flight attendent to have the captain patch the flight comms into their system as you board.

Use of scanners and two-way radios (including cellular) is not allowed during flight per United policy. However, you are free to bring them aboard. At worst, a flight attendent will remind you of their policy. Obviously, you are free to listen from the terminal areas.

I used to work in the Radio Business and was required to get
a Restricted Radiotelephone in order to keep the job. That was actually
a *relaxation*, since the Restricted required NO TEST, just fill out
a form and send it in. Prior to that you had to have minimally a Third
Class (back when there was First, Second and Third - I think now there
is just "General Radiotelephone").....which DID require a test..

EEyup, I agree. Check out Section 605 of the Communications
Act of 1934. That is essentially what it said, that you can LISTEN to
whatever you want, but you cannot DIVLUGE anything you hear except
for broadcast, Amateur and communications related to ships and planes
in distress.

Kind of makes you wonder why the ECPA (Electronic Communications
Piracy Act, IMHO) was even needed, doesn't it?

Keep in mind that you don't have to be talking. The phone just has to be
powered on. The phone's job is to periodically register with the closest
cell site. The information of what commute *EVERY* powered up cellphone
takes is in the computer... of course the cellular carriers would not
look at this information - that might be an invasion of privacy.

>could not make this determination.)

Actually from a LEGAL FAA standpoint the PIC (Pilot in Command) of the aircraft has the ultimate responsiblity. United may make rules that are 'condition of employment' for that pilot. But if something goes wrong the pilot will be the one at fault.

Every flight I have been on has allowed computers and CD players AFTER reaching cruise altitude. Radios are discouraged by the flight attendants, but if the pilot says OK then it's allowed. Cellular Phones are not permitted by FCC regulations do to the number of Cells affected from an airplane.

No. Teletrac uses many high-altitude (i.e. not cell sites) sites in the
LA Basin. These sites are connected together to a central location in
real-time. I believe Teletrac determines location by minute time
differences in the transmission reception by more than one site.

Whoa! As taxpayers, didn't we already pay for the data collection,
entry, and validation of license applications? I wouldn't mind paying
to *access* the data (the output side of the puzzle). if I didn't
have to pay for the *entry* (the input side of the puzzle) as well.

I believe that we *must* pay for one side of the FCC records puzzle;
however, we shouldn't have to pay for both sides.

As far as I know, LAPD is not pursuing an 800 Mhz trunked system.
They are, however, midway through a transision to the new Motorola
ASTRO handheld radio (that does (grin) have voice encryption). 484 Mhz
and 506 Mhz (non-trunked, by definition> frequencies will be used
in the new LAPD system.

Huh? The chopper is flying in the same site that O.J. was driving in. All he had to do was scan the cell band until he found the call. When the call handed off to the next cell he just would scan until he found it again. Nothing hard about it at all.

We did not mishear. The guy plainly announced to the world that he was listening to O.J.s Cell call on his scanner.

Bill Cheek does not describe a mod for changing the Xtal on the 2006.
He has mods described for the 2004 and 2005 (up to 10 Mhz).

The reason for my post was:
1. The mod also works on the 2006.
2. In at least one case, 15 Mhz (not Bill's recommended 10) worked
3. I wanted to quantify the resultant speed for any who wished to
try it.

Why not? It costs to produce the reports. There is no reason that the people obtaining the licenses should have to pay that cost. That means that the non-government users should pay for their data. We all pay for the use of it by the government.

: >a piece of leather and another time a piece of felt, but neither one
: >worked very well. Please post any ideas that you may have. Thanks in
: >advance!

: Carnuba wax. Most materials you try will unacceptably reduce the required
: capacitance coupling of the magmount to the vehicle body. This is what
: gives the antenna it's necessary groundplane. A good heavy coat of carnuba
: wax will prevent the bare *clean* magmount from scratching your car without
: greatly affecting the capacitive coupling of the base to the vehicle.

You will find difficulty getting anything to work. Most of the damage
(scratching) is done by dirt, dust, etc. particles getting under the magnet.
As the antenna vibrates, scratches are formed. I use two mag-mounts, one on
the front and one on the back. I have never been able to stop the "stuff"
from getting under the magnet.

: >Pa,Delaware and New Jersey. I live in Baltimore. The time was about 7pm,
: >is this what is known as skip?
: >Thanks, Phil

: In this frequency range, this is called ducting (or troposheric ducting). It
: is different from "skip" or sporadic E, in that the signals are not bouncing
: off the ionosphere but rather "hug" the ground because of realtive
: temperatures and other factors.

Sporadic E propagation has been reported at frequencies higher than 155 MHz; propagation between PA, DE, NJ and MD was probably the result of what's called "tropo." Short for "tropospheric," tropo is often mistaken for ducting. Tropo is often associated with stalled high pressure systems, such as the one that sat on the Northeast last week. The boundary between two air masses of different temperatures refracts vhf and uhf signals. This boundary region may be several thousand feet about the ground.

Ducting is a less-common propagation mode. A tropospheric duct acts like a pipe, channeling radio waves from one point to another. Both transmitting and receiving antennas must be within the duct. Tropo ducting has been credited for allowing vhf and uhf signal propagation between Hawaii and California. Hams on both ends find they can locate the terminal points of the duct by driving up and down the mountains in their respective states.

The American Radio Relay League, a non-profit organization of ham radio operators by whom I am employed, publishes a couple of books on propagation, antennas and related matters. Some of these books may be available in your library. Email your snail mail address for a catalog.

>a scanner should be legal - using information from your scanner for your own
>benefit should not.

I don't believe this is completely correct. There was a modification to
the Communications Act of 1934 in 1951 which speciffically forbade
broadcasters from recording or retransmitting telephone calls or
interviews without the knowledge of the person(s) being recorded. At one
time they were required to send a 1KHz tone over the phone to "inform"
the person that he was being recorded. As far as I know there is nothing
regarding the Act which deals with recording at all. Only divulging the
contentents of certain kinds of transmissions is dealt with.

My wife owned a Regency HX-1000, and it was a decent scanner.
Although built with the quality of an industrial grade radio, it was
large and heavy by today's standards and the audio suffered from
a high frequency hiss.

Don't forget the later models -- the HX-1200 and HX-1500.
They were pretty neat, too. All three models were manufactured
by Azden.

5427. Antenna Frustration...

Newsgroup: rec.radio.scanner
Date: 1994-06-22 13:51:58 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <2u9flu$kkb@nntpd.lkg.dec.com>
Source record: 272682

First of all.... $*#*#*#*@!!!!!

Now that I've calmed down... I recently installed a Grove Scantenna on the highest point on my house, with 50' of RG6 (Grove recommended) lead in wire to a RS 2026 scanner. I live in western Jersey in the middle of three NWS transmitters - Allentown, New York and Philadelphia. I now receive Philadelphia very well, New York moderately well and Allentown poorly. My location is on the side of a mountain, so it's not unexpected that reception OVER the mountain would be poor.

BUT... Last night I connected my $15 Radio Shack "Ground Wave" base antenna to the scanner with 3 feet of (RG9 - I think, thick coax with PL259 connectors on both ends), held it in the middle of my living room and got NY, Phil and Allentown perfectly.

Is my problem:

- losses on the 50' of RG6?
- directional problems (the Scantenna is mounted on the chimney, off of a metal mounting mast)?
- The Scantenna itself? (I followed directions putting it together)

Thanks!

Signed,
Frustrated in New Jersey,

Unless things have changed, it doesn't cost anything to view the records. I used to go to the FCC office in San Francisco and view the microfiche on their reader. (that was in the early 80's) Bill, did they change the policy?

Subject: Wanted: ND Frequencies for...
Newsgroups: rec.radio.amateur
Organization: North Dakota Higher Education Computing Network
Summary:
Keywords:

Hi all;
I am interested in compiling a list of all frequencies used in
North Dakota. Included would LF, HF, VHF, UHF, etc. Also if anyone can,
please include amatuer repeater frequencies used in state. This list
will eventually include not just the 'normal' PD/FD/SO etc frequncies,
but private businesses, amatuer freqs, and any other interesting things
that you may have heard.
Once I have completed all this compiling, I plan on posting it to
all news groups that applies for greatest dissemination and accesibility
to anyone who monitors anything.
If anyone has any frequencies thatg may be of interest to others
or is especially interesting, please email me your lists, or whatever.
If you are interested in getting this list as it is updated,
please send me your email address and I will be happy to send them to
you. NOTE: I wil not send via snail mail as this is expensive.
If you are located in the local Minot or Bismarck area, I have
already compiled a list of about 5 pages that you may be interested in.
Let me know.

Happy Monitoring !!!!!!!

I get nearly the same result, even in the car. You have to be right on top of
a mobile to hear them. I'll bet your antenna isn't cut for 42 MHz (1/4 wave =
5.8 feet); I know my car mag-mount antenna certainly isn't! The CHP uses
correct antennas, mounted on high towers, to hear the mobiles.

I always wonder how well these scan speed-ups really work. Sure you can "scan" many channels per second as far as the uP is concerned, but the receiver part of the unit needs time to lock on to the new frequency and see if anything's there. Just counting the channels whizzing by on the display doesn't tell you if the unit really has time to stop on any of them. Do you start hearing fewer comms (presumably only the stronger ones) as you reach the "receiver speed limit", or is there an abrupt cutoff?

It would also be a TON of data to sift through. The few records on your particular phone would be scattered among the records for all the other phones. I doubt it stays "in the computer" for long; it's probably "expired" on a regular basis, much like network news. (Except that the cellphone data would be shuffled out to high-density tape as it's expired.)

When a cell phone is first powered up, it will scan the forward control
channels and measure the signal strength on each one. It will then
tune to the strongest one and then decode the overhead control and
paging messages. It will also transmit it's mobile identification
number (NAM). At this point the system knows what cell site the cell
phone is in. The phone will re-scan the control channels and re-transmit
it's NAM every 30 minutes. So the cell phone could move quite a distance
before it's location will be known by the system. The system can also transmit
a page for the cell phone and the cell phone will respond.

>
>What's up with this ?!

In my CHP district, I hear only a fraction of the mobiles, because
the bulk of the activity takes place on the other side of a mountain
range. Even within a typically smaller metro district, the mobiles
can't necessarily be heard by a scanner all the time, only when
they're at shorter range.

Try listening during a rush hour, and set up a pair of adjacent
memories with the base and mobile freqs. Tune to the base, and be
ready to switch to the mobile after the base puts out a call. In
scanning mode, you almost need a zero scan delay as for trunking,
because you can miss a mobile's response to a base station's call
during the delay.

It has also been my experience that CHP mobiles are less talkative
than most other law enforcement mobile units.

Uhhh... it's not that they're directional, just very localized.

> Also, cell phones can change frequencies on their own. If the phone
> moves from one cell to another, and the freq. in use would cause
> interference in the new cell, the phone automatically switches to
> a clear frequency.

Actually the phone ALWAYS switches to a new frequency when it's handed off to a
new cell. Freqs for each of the two systems (wireline and non-) are allocated
in 7 blocks of 45 channel pairs each. (Each channel pair = one channel for
repeater to mobile, and one the other way.) Each cell uses a block, and no two
adjacent cells use the same block.

In addition, the channel blocks and assignment of blocks to cells are set up
so that no two physically adjacent cells will use channel blocks on adjacent
frequencies.

See Bill Cheek's _Scanner Modification Handbook_ for a complete description,
with channel tables.

:
: What's up with this ?!

This is completely normal. The base antenna is up in the air, and the transmitter puts out more power than the mobiles.

Unless the mobiles are relatively close by, you will generally not even hear them, or they will be very weak.

Don't worry about it. Everything is rebroadcast over the repeater, so you will not miss out.

What you speak of is Caller ID...it is a service offered by the
telephone company; Radio Shack just sells the display units.

Basically, on the first ring, a burst of data is sent to the display
unit at 1200 baud. The display unit then interprets the data, which
usually means someone's phone number shows up in the display.

It will *not* work on your phone, as your phone company doesn't offer
the service.

5444. Texas -> Virginia on 162.475 MHz

Newsgroup: rec.radio.scanner
Date: 1994-06-22 16:24:42 UTC
From: jnavary@nyx10.cs.du.edu
Message-ID: <2u9oka$9em@nyx10.cs.du.edu>
Source record: 272689
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

Tonight, as a line of severe thunderstorms was approaching here in central Virginia, I decided to punch in the Richmond NOAA Weather Radio broadcast on 162.475 to get the latest watch/warning info. However, I heard nothing but silence.

I opened up the squelch and could hear a faint signal and figured that Richmond must be running on emergency power with reduced output as they do sometimes during a storm.

Rapidly the signal strength increased and within a few seconds it was full-quieting. The announcer was saying that we our total rainfall was "eight inches above average". I thought that was strange since we're currently in a minor drought with the local farmers all in surly moods since the crops are drying up.

The signal faded once again but within a minute or so it was back up to full quieting. It was then that I heard the start of the forecast for "Southeast Texas and the Gulf..." and realized that Toto and I were no longer in Virginia! It faded again and then - again - back up where I heard something about either their location, or weather observations coming from, Jefferson County Airport.

A quick glance at the atlas shows that Jefferson County is, indeed, in SE Texas, encompassing the Port Arthur/ Beaumont area.

The signal started to come back up and, straining through the noise with my ear on top of the ol' PRO-2006 I came to the moment of truth:

"This is NOAA Weather Radio, WX..."

and, at that "Murphy's Law" moment, Richmond came up on frequency with an alert tone (I think I'm deaf in my right ear now) and a severe weather warning for the area. Go figure....

Now, my plea for help:

Does anyone know which NOAA Wx Radio station I was listening to from Jefferson County Airport, Texas? The Galveston/Houston area appears to be too far from Jefferson County to be in the same listening area -- but I don't know for sure.

Does anyone have the callsign?

And if anyone has a mailing address for this station I'd
sure appreciate that info as well. I'd love to QSL this
station as it's the best DX I've heard above 150 MHz.

Any help would be greatly appreciated.

73,
Jim

>What's up with this ?!

Oh, the mobiles are most certainly there. My main problem with
listening to CHP in the car is generally poor reception due to length of a
decent antenna for that band.

As you may or may not know, the CHP has picked up nearly all of
the old LA Co. Sheriff (LASD) 39 Mhz frequencies. From what I understand,
these "new" 39 Mhz frequencies will be used as inputs to a new repeater
system (42 Mhz outputs).

The frequencies and (preliminary) geographical uses are listed in the
CPRA-FRQ.TXT file on the CPRA BBS (+1 714 704 7903):

Bill Grove - Grove Enterprises (grove@mercury.interpath.net) wrote:
: DATE: June 20, 1994
: TO: Tim Dobbins
: FROM: Bob Grove

Was this intended as e-mail? Anyhow carry on...

: Dear Tim:
: I read the posting of 27 May which was laid on my desk today and was
: astounded by the naivete pervayed in it. Someone up there is working
: overtime embarassing himself!

Yes, I can see by this post that Grove Enterprises is apparently
not working overtime in the sales department by the evidence it only
took three plus WEEKS for this response.

: It IS against the law to import into or market in the United States
: cellular-capable scanner and converters, although there are still some
: folks out there doing it. Javiation, a former MT advertiser and a British
: firm, was warned officially by the FCC not to advertise the MVT-7100;

WRONG!!! WRONG!!! It is only against the law to import for USE such
items. If you do not "officially" plan to use it, but merely store
it for trips when overseas and out of the U.S. and its territories,
there is NOTHING illegal in doing so. Other legal applications
would include the import for re-export to places such as Canada and
overseas. There are no export restrictions on cellular capable
scanners! I am glad you indicated there were still some doing it,
hence nothing is stopping such activity. The FCC does not have the
right to tell companies without offices in the U.S. or its territories
what they can or can not do. Interesting comment in any event.

And since what you actually do with it once its here, is your own
private business, the government can not enforce such import bans
for reasons expressed above. Note, the wording of the law stated
manufacture or import for use. Correct me if I am wrong!!! The
very words "for use" left open a door so large a tank could drive
through! This is why nothing is preventing them arriving into the
country. If they stated possession, they could have done somthing
about it (but there were many already in use, therefore that was
not possible).

I can see why you're only a radio dealer and not a lawyer... :(

: apparently Atlantic has not yet been notified. It is not unlawful for us
: to accept the advertising because we are not doing the marketing.

If it is not unlawful to accept such advertising, even though your magazine has become the marketing tool to market the product, I think you had better re-think your legal standing here...

The U.S. can not prevent a company in a foreign country from sending you advertising for the magazine. If it were illegal to market the device here, and they can not touch the company in the other country, who do you think they will touch... the one company who is providing that advertising service, in this case MT, who is in this country, right?

: The FCC's Form 740, which allows an individual to import up to three
: non-type-accepted devices for his personal use, no longer applies to
: cellular-capable scanners.

Well, explain this, since the form no longer applies to cellular capable scanners, does it apply to non-cellular scanners? If so, was that because they were a non-type-accepted device? Now, since we have laid the foundation for this issue, tell me at what point did non-certified, never seen before by the FCC (in some cases) cellular capable scanners become something other than non-type-accepted devices? They most certainly ARE a non type accepted device, since they carry no FCC certification showing otherwise. This is true with the U.S. Customs as it would with anyone else, because you have now indicated the form can be used on non-type-accepted non-cellular capable scanners -- but not on the cellular capable models. Where or how will U.S. Customs make this determination I ask? They look the same, the U.S. Customs are not technical geniuses when it comes to scanners and electronic devices! Even on the models which do not have cellular, but do have 800 mhz, they often omit the locked out ranges on labels, etc. Most new rechargable scanners need a charge before they would function, and the U.S. Customs have better things to do like stopping drugs than to open every package and test the unit for receiver coverage!

I have not even started to attack the issue of "readily alterable" and how the U.S. Customs will test for that situation!!!

Sounds like Grove Enterprises sees some potential sales problems ahead with an invasion of imports.. oh well (here, borrow my hanky). I'd recommend you start lobbying to get the cellular ban reversed since it not "could" but "will" affect your business activity sooner or later... I think Opto Electronics helped you out -- as I read a rumour you were going to carry the Opto-456 which can override the cellular CPU lockout when under computer control.

Thankfully, the FCC has NO jursdiction over the capabilities of personal computer software distributed on disk!!!

: As of about a month ago we were unaware of any U.S. Customs
: inspectors who had been officially notified of the contraband, but if they
: recognize the package, they have the right to confiscate it.

And that is why when you pay by charge card, you can issue a chargeback to recover yourself, since there would be no signature or other proof you ever ordered it. Merely cancelling the order because it failed to arrive is enough to clear the recipient of charges. But, we are forgetting the points I brough out earlier, we would not be importing the scanner for use, we would be importing it for "storage", to carry, to have possession of, not use, as that would be illegal! If they said "importing or manufacture" and stopped there, you would have a point. I will have to dig out the full text of that law... I am centain it said for use. That is the LOOP HOLE, so LARGE, I could drive TWO tanks through it side by side!

: I was amused by the reference that we might have "sold out to the
: FCC." The FCC is regulatory agency, directed by Congress to enact certain
: rules and regulations. Did you "sell out to the IRS" by paying your taxes
: this year?

I think Tim's point here was the issue that you are the only company who is avidly pushing the "you shalt not", "you can not", "that is illegal", name one other company who is being so aggressively legal, ramming it down our throats in every issue of their magazine (except the most recent copy of MT) and every other opportunity they get??

Instead of advertising the holes as I mentioned them above, and how to articles to get the units in the U.S., your company is biased because you can not resell them yourselves. I would have thought you would have been listing the addresses, part numbers of the chips in the international versions, and instructions to upgrade the made for U.S. market units (non modifiable) to the international equivilents!!

I am referring to purchasing the parts that differ between the units from the manufacturers and refitting them yourself. Your magazine should be running how-to articles to do this with a parts list, the prices, address to order them from, etc. Since the law had no affect on a non-modifiable unit modified by the end-user anyhow, why are you not doing this? Please don't bore me with "its not possible". That may apply to the ICOM R7100, but not any scanner WITH 800 mhz still present in the RF section! Heck, you folks, WERE making a receiver at one time! Why are you not making add-on boards for the 2005/6 to override the CPU and receive cellular? These would not need FCC approval, and the boards and instructions would not be considered a scanning receiver of 4 or more channels!!!

: The availability of cellular-capable scanners IS drying up! We have
: watched as several models have fallen out of production, replaced by
: non-cellular-restorable follow-ons. As the cellular- capable PRO2006s are
: sold out (and they're going fast!), the new, non-restorable model,
: indistinguishable on the outside from the former model, is filling the
: void--but it isn't cellular- restorable.

Well, that is why products like the OPTO-456 are becoming VERY PRACTICAL items to design and market. They literally permit you to OVERRIDE the CPU LIMITATIONS via serial interface and SCAN the

cellular section as MUCH as you wish, even in the non-modifiable
versions blessed by the FCC.

Will you be stressing that above device (OPTO456) as much as I did
in its capabilities when you start selling it? I mean you are pushing
that line on the cellular modifiable units in your catalog right now!
I suspect you will overlook such capabilities when you advertise it...

: Say what you wish about Grove Enterprises, me, and MT, but keep it
: accurate, not as misinformed as what was propagated in
: the 27 May disservice to your newsgroup.

I know Tim, and the information he propogated was also collected from
several sources. Some of these were posts made in Usenet, CompuServe,
America Online, electronic mail, local contacts. Believe me, this is
not one (or two) against Grove, there are quite a few disgusted with
your efforts and interest in recent issues.

Do not mistake this to mean we do not feel MT is good, and that we
will not do business with you, but... we would like to see the old
Grove of two years ago. With a few changes in attitude and direction
it would things around pretty quick!

You're a publisher... therefore why are you not publishing how to modify the
non-modifiable units? Do not say "they can not be modified". That is the
easy way out. You have a research department don't you? Why aren't you
putting the modifiable scanners in the lab, along with the newer non-modifiable
versions along with the international versions and comparing them, taking down
notes on what is different, making a parts list and instructions to re-fit the
newer U.S. models, and publishing the information??? That would be an
excellent service to all of us! It is NOT against the law to publish how
to modify a scanner for cellular if it was designed not to be modifiable, is
it??? I doubt it! It is NOT against the law for the companies to sell the
CPUs and other parts as raw materials to end users as replacement parts??? Is
it??? It would not in any manner affect the law and certification since they
only certify complete units, not CPU capabilities!

I think we had a private round on this earlier, I received your response, and
I responded. Either your response to my response was lost in the electronic
jungle, or else you had nothing to say. Now you took on an attack at Tim as
well... Guess, what... your attitude needs an adjustment, or Universal, EEB,
AES, and several places mentioned in Shortwave Magazine will see more of our
scanning / radio $$$ this year.

I hope this one lands on your desk with a loud thump! Hopefully loud enough
it will wake you up before its too late and before three weeks have elapsed!

The rules requires the license or a photocopy at every 'control point'.
It doesn't say everyone can go there to look at it.

The law requires every FCC office to have the records available
to the public for inspection free.

I'm not a lawyer so this isn't legal advice, it's what I find by reading.

You should, of course, keep pointing out to your police chief and city
council persons who they work for. If you don't stand up and fight for
your rights, you won't have any.

I'm lookoing for freqs' for Police in Wyoming. Specifically I would
like freqs' for the state police, the shariffs of Sublette, Teton and
Lincoln Counties, and the city police of Big Piney. Oh yeah, If that isn't
enough if you got the freq's used by the Foresty Service in the Bridger-Teton
and the Shoshone National Forests, that would be much appreciated also.

Thanks alot.

Can anyone in the San Jose Bay Area tell me where I can find a source
for Monitor Times? I have looked all over the place with no luck..
(Maybe they were just out of stock, but I have had no luck)

Please advise.

Thanks,
Darryl

No you are not liscenced for ham radio. You will need to visit your local VE test session to apply for a liscence. However i think wit your liscence you could start your own commercial station say a around 89.5 mhz.

Coz (stevenp@connected.com) wrote:

: Huh? The chopper is flying in the same site that O.J. was driving in. All
: he had to do was scan the cell band until he found the call. When the
: call handed off to the next cell he just would scan until he found it
: again. Nothing hard about it at all.

You're mixing two different comments together. Let me separate them.

1. Someone said that they heard a CNN guy talking about listening to OJ on
his scanner from the chopper. What I said was that I didn't think a
CNN reporter would say such a thing. My reasoning was that he would
have to be an idiot to admit to a Federal offense on TV. I guess he
was an idiot. I never said that it was hard to listen to cellular.

2. Some ELSE (and I did say "someone else" in the post) mentioned that they
thought that CNN had TRACKED DOWN OJ via the cellphone using the same
voodoo that the police and cellphone company used. My point was that
locating a given car and a given phone number with little clue as to its
whereabouts is beyond the means of most scanner enthusiasts. I believe
that to be "hard" and/or expensive.

: We did not mishear. The guy plainly announced to the world that he was
: listening to O.J.s Cell call on his scanner.

Because Mr Grove appears to have some misinterpretation of the law, I
have included the amendments (changes) below:

Here's the text of the new scanner law.

SEC. 403. INTERCEPTION OF CELLULAR TELECOMMUNICATIONS.

(a) Amendment. - Section 302 to the Communication Act of 1934
(47 U.S.. 302) is amended by adding at the end the following
new subsecton:
(b) (1) Within 180 days after the date of enactment of this
subsection, the Commission shall prescribe and make
effective regulations denying equipment authorization
(underpart 15 of title 4, Code of Federal egulations,
or any other part of that title) for any scnning
receiver that is capable of--
(A) receiving transmission in the frequencies allocated to
the domestic cellular radio telecommunications service,
(B) readily being altered by the user to receive
transmissions in such frequencies, or
(C) being equipped with decodes that convert digital
celllar transmissions to analog voice audio.
(2) Beginning 1 year after the effective date of the
regulations adopted pursuant to paragraph (1, no
receiver having the capabilities described in
subpargraph (A), *B(or (C) of paragraph (1), as such
capabilties are defined in such regulations, shall be
manufactured in the United States or imported for use in
the United States..
(b) Report to Congress.--The Commission shall report to
Congress no later than Jun 1, 1993, on availble
security features for both analog and digtal radio
signals. This report shall include a study of security
technologies currently available as well as those in
development. The study shall assess the caabilities of
such technologies, level of security afforded, and cost,
with wide-spread deployment of such technologies.
(c) Effect on Other Laws.--This section shall not affect
section 2512(2)of title 18, United States Code.

--
I believe you will see in section two, it states imported for use in the
United States. There are other reasons to import than simply for use.
This is why the U.S. Customs can not confiscate them. FCC form 740 states
up to three units for personal use, but does not state in the United States.

If someone has a better text of the full law (an ftp site would help), and not just the changes, I would be most interested...

About the only transgression might be if we were manufacturing them in the U.S.

Also "import for use" could imply the intention of only affecting commercial resale - ie marketing of them in the U.S. by a company located in the U.S. doing the importing. Its sufficiently unclear as to whom the audience was in the wording I could see how import for personal use would not be challenged by the government. I am sure the last thing they want to do right now is to open this can of worms up again (where it could sway the other direction).

I'm damned impressed!!! I hardly ever hear that station myself and I'm 160
miles from that station. The Call is WXK-28 in Port Arthur. Sorry I don't
have an address. Your local NWS should be able to help you with that.
If not, the phone number to the airport is (409) 722-0251 and maybe they
can help. Good job!!

>: one at fault.
>
>That only means that the PIC can make more restrictive rules than those
>imposed by the operator. Thus, if the airline says, "no computers or
>scanners", then he is breaking the FARs by allowing them.

Not exactly. He may lose is job for allowing them, but he has broken no FARs. This peticular section of the FARs is not specific to commercial operations. Therefor the operator is the pilot, an airline is a carrier. An airline or carriers employee rules or policies are not enforced by the FAA. If the carrier wishes to make more restrictive rules than the called out in the FARs thats OK but the FAA will not enforce the additional restrictions.(E.G. If a pilot breaks a FAR the FAA may fine, send to jail, suspend or revoke his pilots license. If a carrier makes more restrictive rule and the pilot breaks the more restrictive rule but not the FAR then the FAA cannot do anything).

Airline rules and policies are not laws:
FARs are laws.

The call they broadcasted was the 911 call that OJ's friend made. All
911 calls made are recorded by the police. I am sure that CNN just
requested the recording from the L.A. Police.

Motorola trunking equipment is available on VHF and UHF bands as well as 800 and 900 MHz in the US. The military commonly uses trunking equipment in the 406-420 MHz region. While an FCC waiver would most likely be required for LAPD, there is no reason that UHF frequencies can not be trunked.

I think that your elected officials are wasting their time and your money proposing legislation to block digital scanners.

Look at the cost of the components required to manufacture a digital scanner. With the DSPs and high speed memory, etc, you won't be selling this thing for a couple of hundred dollars and still be making a profit. Also look at the development costs. It is not hard to guess that the cost of engineering a digital cellular scanner would be MUCH higher than an analog only device. How much extra revenue would this MUCH higher engineering investment generate? I think the economics of the situation are against this ever being done by a major manufacturer. Now a garage shop might be a different story.....

> and the software...

Contact Motorola's parts division. Their number is 800-247-2346.

You will need:
cable RTK4205 to connect to either of the radios
RIB Interface box RLN4008B
Cable from rib to PC (I forgot the number)
MT1000 software
HT600 software

The cost of this equipment is not low, so be prepared.

Maybe you can clarify this for me...

I recall several different accounts of how the cell phone was involved...Probably these differences can be acredited to the ignorance of the media when it comes to radio technology. Anyway, at first the news people were claiming that the truck OJ was in was found by tracking the cell phone from cell to cell. Then they said the police actually called him and kept up with him that way. Several mentions were made to the effect that the cell phone was crucial to the police's ability to find OJ.

Is this not what the EPCA is supposed to guard against? This sounds like wire-tapping to me...If law enforcement suspects that you may be up to criminal activity, does that give them the right to bug your phone? Does that also give them the right to tap into your cell phone?

Seems to me that the American Double Standard is once again alive and well! Not that it ever went away in the first place!

Please clarify this issue...At the very least you can tell me I have my facts all wrong and if that's the case I just shut-up!

Thanks...

Mike Martin - Tulsa.

From my archives, a couple of years ago, when the PRO-43 came out and everyone was praising it as the ultimate handheld:

As a long-time AR-1000 owner who has looked over the fence at the PRO-43, I must temper the unregulated enthusiasm over the PRO-43 with some personal observations. (Yes, I, too succumbed to the ethic that you can't have too many scanners).

First, the PRO-43 scans faster and obviously has more useable sensitivity than the AR-1000. It also has smaller memory banks which are easier to manage. However, it could use 40 more such banks. Fine. Now for the negatives.

If this is a triple-conversion scanner, why are 160-161 MHz filled with interference from pagers and television audio? I thought this was the scanner which was billed as being free from images.

After using the AR-1000 it's almost impossible to live with only one set of search limits. Furthermore, the PRO-43 doesn't have a "search and STOP" function which will stay on a frequency of interest. Of course you can always turn off the squelch to make it stop searching, or hit the MONITOR button to store it ... but at the rate this radio searches, what if your fingers aren't fast enough? Searching through frequency ranges having birdies is particularly difficult, compared to the AOR or ICOM scanners, because there is no way to lock out individual frequencies during a limit search.

For a modern microprocessor-controlled scanner, the data manipulation facilities are terribly weak. For instance, there is no way to simply punch in and listen to a frequency without entering it into a memory channel. To add insult to injury, you can't manually write into the scratchpad "monitor" channels unless you're in the middle of an automated search. Nor is there a way to clear out the monitor channels without resetting the scanner.

I =really= miss the VFO knob on the AR-1000; in fact I constantly reach for it (non-existent) on the PRO-43 out of habit. And there's no functional equivalent, either. In search mode, even with the squelch open you cannot use the up-down buttons to reliably step through the

search range. Why? "Zero-Matic" keeps intruding, trying to track the center of a signal many kilohertz away.

The squelch makes an annoying thump when it opens, and an even bigger thump when it closes. Unlike other users, though, I don't find the so-called "bassiness" of the audio to be a problem.

The LCD display is pitifully small. Even the ultraminiature ICOM R-1 has bigger numerals! The dial light should be CPU-driven like the R-1. Press the button, it should stay lit for 5 seconds. Press the button again within those 5 seconds, it should go off. Press any OTHER buttons during those 5 seconds, it should continue to stay lit for 5 seconds after you stop pressing other buttons. Does it? No.

The belt clip feels so flimsy I'm afraid to use it for fear it will break off. And why, on their best handheld, do they still use the cheapest type of center terminal for the BNC connector? The buttons are too tiny, too, and their travel when depressed is too short to provide positive feedback (I guess that's what the blasted beep is for, eh?) I also expect the white numerals to fall off the buttons, aided by friction from the walls of The Pouch that I store it in. Thankfully, however, that hasn't happened.

Now don't get me wrong ... I'm basically happy with this scanner and don't intend to return it (especially after microsurgery!) but I really felt it necessary to balance the scales here.

> (wb5von)

Bill Cheek does indeed describe the mod for the 2006 in Vol 2 of the
Mod Handbook with the caveat that he hadn't tried it himself at press
time.
I did this mod a few weeks ago, I put the processor from a 2006 into my
2005 along with a 16MHz Xtal and it works very well (40 Chan/sec).
Of course the delay time is reduced by 1/3 but it's hardly noticable
in actual use IMO. I compared the signal captures between my unmodified
12MHz 2006 against the 16MHz 2005>6 while connected to the same antenna
thru a signal splitter and they were identical except on VERY weak signals.

Where either radio would occaisonally miss a signal that the other caught.

I determined that the dwell time per channel was so short that if, at the instant the radio sampled the signal, it was faded out, the radio would not

see the signal and scan right past it. If this is a concern and you are scanning for weak signals then you should scan at the slow scan speed to increase the probabilty of intercepting the signal on the first sweep. If you are sweeping a narrow range when it only takes seconds (ie. <1 Min) to complete a sweep then you should allow the radio to re-visit the freq more often by scanning at the faster rate. This is why there are two scan rates on the radio, with scanning receivers there is a trade off between re-visit rate and dwell time on each freq that must be considered.

Good listening.

Wrong. It is made for Tandy/Radio Shack. It is also considered to
be one of the best handhelds you can buy. The tabletop PRO-2006 also
is highly rated.

Not everything Rat Shack sells is junk - just a lot of it.

Bill

That it's made *for* them by GRE. Triple conversion. Many knowledgeable users regard it as one of the best handhelds available. It is one of the best in its price range, without question. My impression (I own one) is that its performace is very good, but its range of features could be better (there's only one pair of frequencies for search ranges, for example).

The test I did involved the ability to lock on relatively weak as well as
strong signals. If it can't stop on a frequency, it doesn't really work
at that frequency.

Well I identified what the frequency was. It's the Niagara County (NY)
Sheriff's Office.. I forogt to mention in my last message that I thought
it sounded like police operations. Well I finally identified it today after
hearing something about "county court" and yup it was the NCSO.. Does anyone
have any other frequencies for the Niagara County region?

Where does this 30 minute figure come from? It's not in the spec. It
certainly can't be the rate of control channel re-scan if you're moving on
a freeway.

The Restricted Radiotelephone Permit is good for operating AM/FM broadcast stations, and other two-way services such as aircraft radios, taxi radios, etc. It is an operator-only permit. No maintenance or repair is allowed under the provisions of the permit.

If you plan to do more than the basics in broadcasting, take the exam for the General Radiotelephone Certificate, which is now for life, and carries privileges such as maintenance.

To operate any Amateur Radio station, you need an amateur radio operator's
license of the appropriate class for the frequency/mode being used.

Check 47 CFR and I'll bet that even the cops need to post a copy of the license at the control point. The only difference for them is that they only need a station license. The operators don't each need an operator's license as long as they are employees of the station licensee.

47 CFR can be found on the bookshelf at any good college library, and at most large city libraries. Check the government documents section.

: I have been using an L.L.Grace DSP-12 for about a year now and am
: happy with it. It is a very powerful piece of equipment and is under
: utilized with it's present firmware. Is anyone doing any programming
: for this device?

There have been some interesting applications developed but they are few and far between. I have an oscilloscope program that Brooks gave me a year or so ago (but I don't know whether it is available for public distribution). Also right now there are some audio filters posted on Ko-23. I've not tried them yet but they look interesting.

: Is firmware version 2.0 the latest?

yes
: Is the AEA DSP
: unit programmable and if so are programs written for it compatible
: with the DSP-12? Any info or opinions welcomed.

They are not compatible... if I'm not mistaken it even uses a different DSP chip.

You may or may not know that LL Grace has a developer's kit for sale for $25. I know Brooks has been puzzled as to why there has not been more development activity. One reason, I think, is that there is no way to upload additional programs to the unit. If you upload new firmware it replaces what is in ROM, it doesn't augment it. So you go through an upload proceedure to put an additional program in, but the next time you want a 9600 baud modem you have to default to the ROM, but if you want the new program you have to upload it again. You really have to think twice before deciding to upload

The best item that I can think of is a piece of 0.050" Teflon(tm) - it's not cheap, but that *will* work, provided you have an exceptionally strong magnetic mount (e.g. Wilson's mount, the K40 mount, the big-dollar RS mag mount)

You'd need to tune the antenna with the Teflon in place - it could make a difference in the VSWR readings...

I've never tried it; but it should work...

The old PRO-2004 is getting a bit old. Besides trying Radio Shack, anyone have some ideas where I could look for a replacement EL701 or GE part GE-85D-6011 (electro luminescence or back light) and keypad panel GE-86D-6358? A friend of mine went to RS for the backlight (which I see is also referenced as GE-85D-6067) and they said they do not stock them anymore. They did order something and it turned out to be smaller (possibly for the 2005 or 6. You could see the PC board around the strip when installed. He returned it. My keypad is wearing out too. The radio is modded so having one of those 400 channel pads would be OK too. Seven years plus and still kickin'. Guess the easy way out would be to get ahold of GE. Anyone have a phone number for them?

Well, maybe you should update the ARRL Handbook since it describes what you call "tropo" as tropospheric ducting (although I realize that there are many such weather related phenomenon and rigid terminology falls short of quantifying the many variables involved). The main problem with calling something just tropo or tropospheric, is that this is an adjective that is not modifying any noun. I would think anyone familiar with the english language would feel a bit awkward using this as a technical term to describe a scientific phenomenon.

5499. Legal US Cellular Scanner

Newsgroup: rec.radio.scanner
Date: 1994-06-23 11:11:08 UTC
From: steven@sgb.oau.org
Message-ID: <CruKEM.9y8@sgb.oau.org>
Source record: 272576

In reading alt.2600, I found these instructions regarding cellular monitoring and scanning with legally available equipment. I guess this means that as of April 26, 1995, you will no longer be allowed to manufacture or import for use in the United States any cellular telephone:

From: Byron_Ng@mindlink.bc.ca (Byron Ng)
Newsgroups: alt.2600
Subject: Oki 900 Cell phone (can scan or transmit on any cell channeL
Date: Tue, 21 Jun 94 21:55:44 -0700 (PDT)
Organization: MIND LINK! - British Columbia, Canada
Lines: 38
Distribution: world
Message-ID: <47321@mindlink.bc.ca>
NNTP-Posting-Host: mindlink.bc.ca

this is the number for the OKI 900 Model cell phone:
NOTE: the AT&T model 3730 cell phone is also the SAME thing)

1. turn on the phone
2. press 7 + 9 keys simultaneously.
3. press MENU
4. press SEND
5. press END
6. press RCL
7. press STO
8. press CLR

if you typed #1-8 properly, the telephone will say "good timing" on its display screen.

then:
9. press CLR
10. press 1+3 simultaneously to activate test mode. the display will clear., and all the lights will turn on.

11. now you can enter any of the test commands.

the format is "command" then "SND"
example

(do not enter the # sign)
24 = displays ESN
09Xxxxx=<--- XXXX is the channel frequenc
12= enables receive on the specicfied channel
14= enables transmit on the specified channel
22= displays NAM info.

--

Notice the last part... Transmit and receive capability. I guess it is now
time to purchase one of these for my monitoring collection!

>I believe you will see in section two, it states imported for use in the
>United States. There are other reasons to import than simply for use.

The actual regulation does not say "imported for use," it just says
"the manufacture or importation of scanning receivers, and frequency
converters designed or marketed for use with scanning receivers, that
do not comply with the provisions [that ban cellular coverage]
shall cease on or before April 26, 1994."

I'm not aware of anyone who has tried to import scanners not certified for
use in the U.S. on the pretext that they will not use them in the U.S.
Have you done this successfully?

>This is why the U.S. Customs can not confiscate them.

Customs can bar importation. If the products are imported and the FCC
finds
a violation, the FCC can issue a fine or request Customs to issue
redelivery notice. If the importer doesn't redeliver, Customs can fine
them.

An easy way to improve your 30-50 scanning experience is to make a 10 foot dipole (468/frequency in MHz = length in feet, so 468/46.8MHz which is in the cordless phone base band, equals 10 feet) out of Radio Shack speaker wire (24 feet of #42-2478 on page 23 of the 1994 catalog). Also, get a RCA to BNC adapter. Take one end of the wire and cut off the BNC, leaving a few inches of wire on it (you'll use it later). Take the 23 feet or so of wire and seperate the cut ends about five feet apart so that it stretches ten feet end to end. Mount this dipole on the wall, ceiling, or somewhere up off the ground. You may find slightly more signal strength if you mount it vertically. The rest of the length is so you have plenty of wire to run from the antenna to your scanner. Of course, if you need a longer wire run, use the 50 foot wire. Since 30-50 is a pretty low frequency, cable losses are minimum. You'll be amazed at the improvement in low band performance from this inexpensive antenna. Now, for that other BNC end piece you cut off, seperate the wires until you have about three inches of wire on each side. Use an ohm meter to determine which wire is the center lead. Completely cut off the ground wire and leave two or three inches of the center conductor wire. Get another RCA to BNC adapter and you have an average antenna for cellular and more importantly, a good antenna for very strong signal situations where a regular antenna gives you overload. Since this short antenna is almost worse than a rubber duck, it is ideal for use at concerts, finding wireless mikes, etc. without picking up other interference.

>I just bought a Pro-43. I'm not sure it's worth the money.

>Anybody got any negative or positive things to say about it.

The only negative that I've experienced is that it seems to have real intermod problems on the VHF-HI frequencies (150 MHz - 170 MHz) that has made it very annoying to use for listening to the local police/fire activity. The railroad monitoring types on Compuserve seem to have pretty well written on the Pro-43 for their purposes because of the IM problems.

On the positive side, it is a really well designed unit that seems born to listen to 800 MHz -- not that I would do that of course :-) Given a choice, I would buy it again.

Can anyone give me the frequencies that will be used for
the airshow this weekend at Troutdale, OR? What are the
normal approach, tower and ground frequencies, both
civilian and military?

Please reply via e-mail to

mark_johnson@mentorg.com

since I don't get much chance to read news these days.

Regards, Mark.

I was asked by a previous employer to develop a CID product to
complement our network security product line. When I told him it
was'nt supposed to be legal here in Ca he replied "B--- S---. So That night
while scanning through the latest copy of Nuts And Volts I found
an advert by some company who thought this evil technology should
be exposed and it listed a phone number to call to allow you to
verify if your phone company provided it. So I called the number
(sorry, I cant find it :>( ) And a voice answered the call with a
response like " I know who you are _insert your pho # here_. "
This was followed by a pitch for a product I cant remember.

It may or may not be legal in Ca, but ITS HERE :-(

I believe the the re-scan rate is different for different vendors. But I
believe that Motorola phones re-scan every 30 minutes. And yes, the cell
phone could be many cells away from where it was when it was first powered
up. If there is a call for that cell phone, the system will page in the last
known cell. If there is no response from the cell phone the system will
page over the entire system.

One item mentioned recently was that the fleeing vehicle was described
over the radio and several people called the police with their cell
phones and reported the location of the white bronco as they drove
in close proximity to it or if it had passed them on the highway.

That'd certainly be a legitammate way for cell phones to
have helped in the locating of the vehicle.

Well the 154.905 is a low power vehicle extender. You have to be
rather close to hear them. I have heard them before. If USENET
is to be trusted, this extender is automatically turn OFF once
the vehicle starts rolling.

If you were serious about wanting to buy one, you'd find the phone number yourself! Getting the number of the main U.S. office of a large company like ICOM is just not that difficult.

You could start with the fine print in their ads in the ham and monitoring magazines. Or, if you have an electronics reference library nearby, check the Electronic Industry Telephone Directory, or the Thomas Registry, or the EIA Member Directory, or any of half a dozen other sources.

The section of the 1934 act under discussion did not mention recording, tape or otherwise, at all. But sound recording technology WAS available at the time, Edison's phonograph being many years earlier. I think there may even have been wire recorders in commercial use by 1934.

In any case the restriction on "divulging" the contents of a radio transmission has been interpreted as applying to all means of subsequent "relaying", whether written, by word of mouth, or by an actual audio recording.

(When did the Germans invent the Magnetophon? (First widely used tape recorder.) I know they were using it early in WW II, but I don't remember when they got started with it...)

I've had my '43 for several months now. I think (and it seems
to be consensus) that it is a very good handheld.

Good Points:
Triple conversion resulting in fewer images.
Military air band coverage.
Key missing 800 mhz ranges can be restored.

Not-So-Good Points:
I have experienced pager images in spite of the triple conversion
circuitry. To be fair, though, my main listening site is only a
proverbial stone's throw from the pager tower. Another irk that
some others have experienced (but not me yet) is an apparent
fragility of the finish. Again, in all fairness, I am SUPER
careful with mine not to let it drop, etc.

Listening to the Houston Police frequencies on the 'ol scanner after the Rockets won the NBA championship was quite interesting. Many reports came through about people shooting off their guns and rifles. Lots of reports of people starting fires, although none of these reports could be substatiated. Also, lots of reports of people just stopping their cars in the middle of the road, getting out, and running around. It was pretty wild in Houston last night.

With all this said, the party crowds were relatively well behaved.

Hi... I am about to start writing a program that will store frequencies and what they are and stuff like that for probably up to 10 different scanners. It will also be able to generate reports based on frequencies, frequency discription, and channel number on the scanner. I am interested in what options you would like this to have. It will be a MS-DOS program written in FoxPro, and if it is a good program then the conversion to Windows will be under way. Please e-mail me on your ideas that you would want. How many channels should I make this program capable of per scanner. Also could someone email me all the information on Grove, phone, address, and if they have a catalog. Thanks.

Hey Steven, lighten up. I was addressing the original posters
comment " Listening to
>: >a scanner should be legal - using information from your scanner for your own
>: >benefit should not."

Isofar as what that has to do with TAPING, it seems to me that
if you can listen to something legally, you should be able to TAPE
it legally. NOW, what you DO with the tape after the fact is entirely
another story.

Sorry that I had to explain what I thought the connection between
them might be.....

It's a great Idea, I would make the number of frequencies tracked as unlimited as possible. However as far as the number of scanners and channels why only 10 scanners? If you make a field that is a 16 bit unsigned integer then that allows 65535 scanners, same for the channels. While I don't specifically know FoxPro if it supports rational database operations then you could have a database for the frequencies, and one for each scanner. Each entry in the scanner database would represent a channel. I would reference an entry in the frequency database and display the information from both. This would allow the limit of frequencies, scanners, and channels to be limited only by the amount of disk space you have.

Also MS-DOS is a good practice plateform.... But skip Windows and go right for OS/2!

>
> Seems to me that the American Double Standard is once again alive and
> well! Not that it ever went away in the first place!

Your facts aren't *all* wrong -- just incomplete...

First of all, you don't mean the ECPA per se. It was (mostly) a set of amendments to the older wiretap act, generally known as Title III of the Omnibus Safe Streets and Crime Control Act of 1968, and formally known as 18 USC 2510 et seq. The main thrust of the ECPA was to extend the protections of the wiretap law to non-voice communications. The older law protected phone calls only. I confess that I don't recall if the wording of that statute would have covered cellular calls or not, though I could look it up if anyone cared enough.

Second -- Title III was passed in response to a 1967 U.S. Supreme Court decision. The Court held that people making phone calls did indeed have an expectation of privacy; as such, the provisions of the Fourth Amendment applied. Thus, the police could not place wiretaps -- unless they had a warrant from a judge.

So -- the wiretap law does not bar police eavesdropping. Rather, it sets the same standard as is required for any other sort of police search: probable cause, as demonstrated to a judge. Much of Title III is not concerned with prohibiting wiretaps, but rather, with setting forth the conditions under which wiretap warrants may be granted. The standards turn out to be pretty high; the cops can only get such warrants for a specific set of serious crimes, and only if they can show that other forms of investigation are likely to fail.

In this case, according to at least one posting to this newsgroup, a warrant was indeed issued. To be sure, there are also provisions for short-term emergency wiretaps, where they have to talk to the judge within 48 hours; I don't think that was needed here. They knew he was in that car for several hours before they found him.

The callsign for the NWR station you DXed is WXK28 and is serviced by the Beaumont NWS office which is soon to be absorbed into the Lake Charles office. The Houston/Galveston area is serviced by two stations; KHB68 162.550 (Galveston) and KGG68 162.400 (Houston). The office for the Houston/ Galveston area is the Houston/Galveston NWS Office located in Dickinson.

Unfortunately, I do not have the address for the Beaumont office, but a telephone directory for Beaumont should have the office listed under "Government- Federal".

Hope this helps!

: ** Via the Aardvark Burrow BBS - 1-716-383-1372**

Well, yes and no. Anyone can start a station - after they receive an FCC
license for that station. All the Restricted Class license allows you to
do is act as a DJ. You cannot install or maintain the transmitter. Nor are
you allowed to adjust the output power, frequency or modulation level.

>only be gained by presenting a positive image to those outside the hobby.

>When scanners are outlawed.....

The heart of the problem (looking at it from the other side of the fence) is
that mobile communications (i.e. PDAs, cell phones, palmtop computers, mobile
e-mail etc. etc.) is big business on the horizon. Millions of people want it,
and big companies want to provide it. This causes people (businesses and
politicians) to re think the existing laws on communication privacy. Many of
the new mobile communication technologies will fail if providers can not
guarantee privacy. As scanner enthusiests we say "if the airwaves can pass
through my body, I have a right to know what information they contain" and
"freedom of the airwaves". We will soon be dinosaurs. The demand for new
technology is going to cause the laws to change. Since there will always be
people like us that monitor everything from DC to daylight, companies are
forced to use digital, spread spectrum, encrypted, and trunked communications
to try to provide personal, private, mobile communications for their
customers. The bottom line is: that's what the majority wants (well, at least
the upper-middle class :-)).

Cross-posted to:
rec.audio,rec.radio.noncomm,rec.audio.misc,rec.audio.tech,rec.radio.amateur.antenna,rec.radio.scanner,rec.radio.broadcasting

I'm writing an article for my station here in Washington. What I want to know is if there is a "better" design for an antenna than the "Sterba Curtain" antenna. What I'm looking for is an antenna that can be built by the average joe/jane that is tuned to a specific frequency that can be used to pick up a station say, thirty or fourty miles away (we're only a 100 watt station, soon to upgrade to a 500 watt transmitter). From what I've read, the best design is this "sterba curtain" design, with the base measurement of 62.5 inches (our frequency is 89.9 FM). But this design may be a bit to large for some people to build.

I'm also curious as to the effect of grounding. That is, where placement of an antenna is adversely affected by its enviorment (i.e. putting your antenna on the outside of your aluminum-sided house!). How could these effects be canceled, and how far should an antenna be away from these "grounded" materials before the signal will come in? How far up should an antenna be from the ground? How far away from your reciever can the antenna be?

A lot of questions I realize. But what the hell, I'm curious! If anyone could direct me towards a good book on the subject I'd like that too.

>... a replacement EL701 or GE part GE-85D-6011 ...

The part number is actually GRE's, the Japanese firm that made the radio. GE would appear to indicate a unique GRE specification and 85 the year of the design spec. Based on the number, GE-85D-6067 would seem to be a related part (mounting bracket, wire harness, etc), rather than a replacement ELP.

You might want to try Radio Shack Natl Parts yourself, rather than relying on a salesman to understand exactly what's needed and relaying that to Natl Parts. Call
Tandy National Parts
900 E. Northside Dr.
Fort Worth TX 76102
(800) 442-2425

and give them the catalog nbr of the radio. With the part nbr and the reference (EL701), they will be able to tell you if it's in stock, if there's a replacement part, and the price (probably $10-15). Natl Parts is probably the best organized division in Radio Shack (and how's that for damning with faint praise <g>).

I've had one for about a year. I think it's great. I've moded mine
so that it picks up the whole 800Mhz range (celluar et al), and that adds
a whole new dimension to it. I also bought a different whip antenna
for it, that helps in certain freq ranges. It's a nice radio, and
a good performing handheld. The only think I wish it did was WFM so
that I could use it as a regular FM radio.

Yeah, so much for the people controlling the government. The phone companies with all their lobbying power (money) managed to, for the first time, re-write the FCC's long time poilicy in which the airwaves are free to be monitored. Well, I have'nt heard of any case in which these recent laws have been tested (ie: the scanner police break in to your home and start scanning your scan banks) but, if any case arises, I hope that the defense points out one interesting fact about Cell phones...
You can scan cells with your old UHF TV!
Yes it is fact, every American can now listen in to Cell phone conversations to their heart's content. Simply tune to UHF (not cable!) channel 80-83.
All 3 of my TV's can monitor the Cells, and my Misubishi with digital tuning can even pull out a single conversation with the touch of a button. Yeah,sure sometimes it gets kinda hard to isolate 1 conversation with the TV's wide band reception, but if your cells are not too crowded it's no problem.

5550. Public Perception of Scanning

Newsgroup: rec.radio.scanner
Date: 1994-06-24 12:33:10 UTC
From: David Harpe <david_harpe@mm.cobb.ziff.com>
Message-ID: <CrwIvA.2J5@zcias2.ziff.com>
Source record: 272604

Since the enactment of the ECPA and the subsequent ban on manufacturing of equipment for cellular monitoring, many megabytes have been written touting the unjustness of this legislation. Unfortunately, many new scanner listeners are getting the impression that if you can't listen to cellular calls, then why bother buying a scanner? Looking at this newsgroup is enough to discourage any newbie from buying a non-modifiable scanner. The popular scanning rags are just as guilty.

As scanner listeners, we need to provide a better image of the hobby. We need to encourage as many individuals as possible to buy scanners and use them. This will accomplish two major goals: 1) Provide us with a larger voice, so that as more goofy legislation is presented, we will have more people who can oppose it. 2) Keep prices down on equipment, and encourage the development/manufacture of new equipment.

Not only do we need to attract new listeners, but we also need to alter the public perception of our hobby. Lets face it, when the public sees something like the 20/20 story on cellphone listening, they get the image of a bunch of perverted radio geeks huddled up around a speaker in a basement somewhere spying on their private conversations. It's hard to generate sympathy and support with that type of image. It's also hard to defend the right to spy on people's phone calls. We all know that it's not about that.

It's hard to explain to a non-technical person the right to monitor communications on the shared public airwaves. The media doesn't do much to help our cause. And it's our own fault for giving them basis for their propaganda (i.e. anonymous submissions of cellular phone call tapes, agreeing to on-camera interviews showing how to monitor things, etc.).

Okay, so what do I suggest we do? Tone down the emphasis on monitoring phone calls. All of us here know it's possible and most know how to do it. By continually stirring up the issue, we provide a bad image for people looking in from the outside. Emphasize the benefits of other forms of monitoring, such as public safety, amateur radio and police monitoring. Encourage new people to purchase scanners. When they ask about cellular, tell them that yeah, cellular monitoring is illegal and hard to do without a modifiable scanner, but that there's a lot more stuff out there to hear. Deny access to the media unless they are doing a story on something positive. Don't do silhouetted interviews in your radio shed, demonstrating how easy it is to listen to phone calls. It doesn't do us any good, they don't usually pay people for that stuff, and you could end up in legal trouble besides.

Hey, I know the monitoring restrictions stink. I sent my letters, called my congressmen, etc., and it still didn't work. It's frustrating. I'm not saying that we should ignore this radical deprivation of rights. But at the same time, we need to rethink our attack plan. With the large manufacturing lobbies pressing for restrictions, along with the carving up of the spectrum for commercial interests, our hobby is going to have a hard time staying afloat. We need more support, and that support can only be gained by presenting a positive image to those outside the hobby.

When scanners are outlawed.....

: JR> heard about triangulate someone's position before, but is it
: JR> accurate enough for hams to do on their own, like this ham was
: JR> talking about? Any info would be great!

: Hi, John...It would be pretty far-fetched to know the serial number and
: the type of unit he is using to make the offending broadcasts.
: Triangulating someone is not impossible. Matter of fact, about 6 months
: ago, someone had broken into a police frequency in the 470 range. They
: were carrying on and making abusive statements on the radio. An officer,
: who is also a ham, was called in to track them down. They were making
: broadcasts on a handheld radio while driving around in their car. They
: happened to be parked when the ham/officer was able to catch them in the
: act. The suspects were apprehended and charged with improper use of a ham
: radio and making broadcasts on an unauthorized frequency.
: Some hams can afford expensive equipment. It's what they enjoy doing, so
: I would believe that these operators were able to pinpoint his location.

Getting the serial number this way is impossible. If you look
at my tag line, you will see that I am an amateur operator.
One of my hobbies is tracking transmitters. I can tell you
that you do not need multiple people or vehicles to track a
transmitter. I have a directional finding system installed in
my car that allows me to drive right to the transmitting antenna.
I do not need any other trackers to find the antenna, only myself.
If I can hear the signal, in 15 to 20 minutes, tops, I have found
the location. The directional I use was inexpensive, I built it.

Newsgroup: rec.radio.scanner
Date: 1994-06-24 14:06:24 UTC
From: reda@gandalf.rutgers.edu
Message-ID: <Jun.24.10.06.24.1994.4404@gandalf.rutgers.edu>
Source record: 272607

My $.02:

I snagged one too. It's a great idea, but, here are some observations.

I've used it in my car, and noticed that the transmitter drifts around the set frequency. It's set by turning a dial, so its not real precise.

If you use a Pro-43 and keep the priority feature on, you'll hear an annoying buzz-humm-click (choose your favorite) every time it checks channel 1.

Other than that, it delivers much clearer audio (thanks to my car's tuner and speakers).

Another hint: the buzz-hum-click is less pronounced if you turn the bass down.

Enough pennies from heaven....

5553. USAir says 'NO' to scanner

Newsgroup: rec.radio.scanner
Date: 1994-06-24 15:33:44 UTC
From: scsavett@acad.ursinus.edu
Message-ID: <009806DD.69F7B440.4734@acad.ursinus.edu>
Source record: 272606

Hello. I have seen posts here before regarding scanners on aircraft. On a recent flight from Philadelphia to Indianapolis, I asked the USAir flight attendent to check with the captain about using my scanner at cruising altitude to listen to fire and EMS broadcasts. He came back and said 'NO'. I was displeased, but understanding. Is this a company-wide thing or just the preference of this USAir pilot?

Thanks. Please post/email replies.

5554. Advice Wanted for Beginner Scanner

Newsgroup: rec.radio.scanner
Date: 1994-06-24 15:57:56 UTC
From: jpsmith@umcc.umcc.umich.edu
Message-ID: <2uevq4$p3l@umcc.umcc.umich.edu>
Source record: 272608

Hello, all. I've recently dug an old, 10-channel crystal scanner out of the closet and have had enough fun with it that I'd like to buy something that's a little more versatile! I would like a handheld scanner, and really don't want to spend more than $200...under $150 would be nice. I'm just a beginner, so I figure I can graduate to bigger and better scanners in the future. I'm guessing that most of the basic scanners will cover the freq ranges that I'm most interested in - police, fire, rescue, etc. How about cordless phones? (Aren't they somewhere around 49Mhz?) That may be fun as well....

Any advice would be greatly appreciated. Reply via email is preferred, but I'll try to check back here as well.

Yes, another request for frequencies of interest.

I'm going to be up visiting my folks for a weekend. They live in
Vacaville, CA (if you didn't guess that already), near Travis AFB.

Solano county, also sort of between Fairfield and Davis. By the
Nut Tree. That's how every one from CA knows Vacaville.

Any one know of any good scanning frequencies in the area? I sort
of want to show them what this scanning stuff is all about. Watching
the OJ chase has got them interested...

Big thanks to any one who can help!

5557. Seattle killer caught by scanner

Newsgroup: rec.radio.scanner
Date: 1994-06-24 16:40:09 UTC
From: michaeha@soul.tv.tek.com
Message-ID: <2uf299$af0@news.tv.tek.com>
Source record: 272609

There was a story on the news last night about a guy who got caught bragging about killing somebody over his cell phone. They actually reported that someone was listening to it on a scanner and they tape recorded it. They caught the killer but can they actually use information obtained illegally to prosecute him? The story didn't mention anything about it being illegal to listen to cellular calls. What is the penalty for listening to cell phones with a scanner?

Mike

5558. Scanner database

Newsgroup: rec.radio.scanner
Date: 1994-06-24 17:01:02 UTC
From: scott@redstorm.nawc-ad-indy.navy.mil
Message-ID: <199406241700.MAA18449@news.cs.utexas.edu>
Source record: 272610
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have already written a scanner database program for DOS. Right now I am fine tuning it to add more features and streamline the functions. It allows an unlimited number of frequencies and an unlimited number of scanners (actual number is limited by hard disk space). Each frequency is stored only once in the database and is connected to whichever scanner it is entered into through a separate record which contains the channel number for that scanner. This saves a lot of space in that you do not have duplicate records for the same frequency (although you may enter the same frequency again for a different user).

You can also store other information for each scanner such as your search limit frequencies and description for each search limit (i.e. the PRO-2006 has 10 pairs of search limits). There is also an area for a description of what each frequency bank contains. There is no limit to the number of banks or search limit pairs that can be added for each scanner.

The following are the reports that are generated at this point (I may generalize it later so that the user can define which fields he wants on the report):

1. List of the current frequencies for a given scanner by channel #
2. List of the current frequencies for a given scanner by frequency
3. List all frequencies in the database by group
4. List all frequencies in the database by subgroup
5. List all frequencies in the database by county (or city, or state)
6. List all frequencies in the database by frequency
7. View/print search limit pairs for scanner
8. View/print bank information for scanner

There is also a separate record for notes for each frequency that can be added as desired.

The program is written in C and uses the dB_Vista libraries for the database portion of the program (I HATE dBASE, FOXPRO, etc.). This method gives much less overhead and faster execution.

If anyone wants any more info please e-mail me and I'll put together a more detailed list of features. I'm planning on releasing this as shareware once I have it completed and documented. Right now I have approximately 1100 frequencies in the database and 2 scanners (I use a PRO-2006 and a PRO-34).

Hi, I just bought a Pro-2006 and love it dearly.. I want to get the most out of the unit and would like to start adding lots of nice features to it. I know about the simple Cellular mod, the speed increase mod etc, but I would like to know what else people have done (or can do) to the 2006..

I have heard about some Scanner mod books around (Vol 1 & Vol2), but how much of these books relates to the 2006? (If at all?)

So should I buy one of these books ? If so, which one?

Last Q. I would love to hear from anyone that has the OptoScan 456 interface. Pro's, con's, value etc...

Looking forward to your responses.

|>breaks a FAR the FAA may fine, send to jail, suspend or revoke his pilots
|>license. If a carrier makes more restrictive rule and the pilot breaks the more
|>restrictive rule but not the FAR then the FAA cannot do anything).

Sorry, you are wrong.

The FARs clearly state that the PIC of an air carrier flight is NOT the operator. The operator is the holder of the air carrier operating certificate, which would be United Air Lines, not the pilot. The PIC is responsible for compliance with the FARs, thus he or she WOULD be held responsible.

The FARs basically say that with the exception of the items listed in 91.21(b), everything is illegal unless the holder of the operating certificate wants to step out on a limb and permit something else.

If you don't believe me, contact your local Flight Standards District Office (FSDO) and ask them, but please stop making up your own interpretations of the FARs.

I agree with this (and everything else in the original post). Talk up
scanning! Put emphasis on what you can hear legally!

- Weather Radio (yes I know cheap weather radios are available)
- Amateur radio 2-meter band. (Even if your not a ham, there is
a wealth of traffic-related info during the rush hour. Especially
during bad weather. Severe weather nets are VERY COMMON when those
tornados and thunderstorms hit the mid-West!)
- Sheriff/State patrol (also usefull to detect those traffic jams and
know what to avoid).
- UHF/VHF Police/Fire (be informed of crime in your neighborhood, the
media does NOT catch it all)
- GMRS block watches and other activities
- Listen to the security force at the local shopping mall.
- Hear the local news as it happens. You can even catch those TV news
reporters on UHF as they talk back to the studio.
- And a wealth of hobby-related stuff for your kids and you such as
railroad and aircraft monitoring.

If we talked up a CLEAN (as above) rather than DIRTY (the clandestine
monitoring aspect) hobby, we would be MUCH better off. Start doing this
NOW, before it's too late!!

Certainly. As long as it was a private citizen, and not the police who did
the monitoring and recording illegally.

Of course, the citizen might be tried for the federal offense. I do not
recall the allowed penalty. I suspect it is substantial.

i first heard the pursuit on 154.905, which is the CHP Extender frequency
(i guess that means there was a CHP cruiser within say a mile of my location)

when the cruiser headed towards the pursuit a few minutes later, the signal got
weaker and i continued scanning & came across the pursuit on OC RED 460.025 Rptr
i was amazed that the Station 18 units were able to reach the Orange County
repeater sites from LAX . . . maybe they have powerful transmitters in the
trunk of the Sheriff's unit. all the more reason why 460.025 makes a great
clemars frequency! even LASO helicipters were communicating w/ CONTROL ONE
on RED.

The developers kit was more expensive when I purchased it. Also, it doesn't include any modems (except for a test one I think). The only sample code is the V40 code, not DSP code.

Scott,

The scanner can actually interfere w/navigation and comm systems on board.
All receivers have low power oscillators that cover a wide frequency range
and the pilot didn't want your scanner 'sweeping' the critical frequencies.

The 800 numbers do not get CID. They receive the number by a different
route. I don't know about the 9xx numbers.

Don't know aboout Ontario or about the belt clip but the only two places
I have heard mentioned are Howard Bornsteins Company Design EQ who produce a
leather case, I'm not sure on the price but you might want to
check with him on CompuServe 76174,637 and I think he still has
an ad in th back of MT. I have heard other people mention "Pouch"
case available from somewhere.

> the monitoring and recording illegally.

In fact, that isn't clear. Here's the wording of the relevant law, from Title 18 of the U.S. Code:

{ 2515. Prohibition of use as evidence of intercepted wire, oral, or electronic communications

Whenever any wire, oral, or electronic communications has been intercepted, no part of the contents of such communication and no evidence derived therefrom may be received in evidence in any trial, hearing, or other proceeding in or before any court, grand jury, department, officer, agency, regulatory body, legislative committee, or other authority of the United States, a State, or a political subdivision thereof if the disclosure of that information would be in violation of this chapter.

Not that it does not say that the illegal interception must be done by a police officer for the evidence to be barred! I seem to recall reading some law review articles stressing this point; I may have the pointers lying around.

Try your local Radio Shack(s). They may still have some of the
Pro-46 (Handheld - 100 channels VHF-Lo/Hi,UHF,800) around at a good
price. I have one as a second scanner and am more or less happy with
it. It'll pick up all the things you mention.

> judice@sulaco.enet.dec.com

Dear Frustrated

The difference between getting a signal poorly and getting it perfectly
can be only a matter of a few dB. A 10dB signal-to-noise-ratio (SNR)
is considered the minimum for an intelligible signal. The signal will
sound very weak and you will hear a LOT of static. However a 20dB SNR
will give you a very clear signal with only a little static and a
30dB SNR will give you a clear signal with no static. The most likely
cause of your problem is multipath distortion, caused by many different
phases of the signal hitting your antenna at slightly different phase
angles. This can cause some wave fronts to cancel out others and create

nulls on your antenna when placed in certain locations in/on the house. You have probably experienced this on your FM stereo as you move the antenna around. The mountain close to your house creates shadows in the signal and prevents you from getting a signal directly from the transmitter by masking the line-of-sight path. Your signal path MUST come from reflections and/or from beam spreading thus leaving you vulnerable to multipath distortion. I'll bet that if you walk around your living room with the "Ground Wave" antenna you will find many places where you can't receive the signals in question.

Good listening

--> the preference of this USAir pilot?

To just kind of piggy-back with this, I recently (i.e. last week) flew
via DELTA to Las Vegas and back. Durring the pre-flight breafing, the
flight attendants told us a list of the "approved" P.E.D.'s (Personal
Electronic Devices) with in the SKY magazine (put in the Liturature
pocket in front of us). On the list of devices that could be used
durring level flight (i.e. NOT durring taxi, approach, take off, or
initial climb) was VHF scanners. I pulled mine out (PRO-46) and asked
the flight attendant to ask the captain what frequency the flight was on
so I could listen in. (I was thinking that by being on the target for the
air Traffic Controlers, I would be able to hear what was going on...not
the case, but another story.) The flight attendant came back and said
"They are on 128.55, but you can't use that on this flight," and the
reasoning behind it was that it had a VOR in it. (I know that VOR stands
for VHF Omni-directional Range finder, but I didn't tell her this). I
told her that VHF scanners were listed as approved equipment for use
durring regular flight, and, in short, that the company and the captain
should be using the same rule book. She checked back with the captain
(telling me something about having to check a log) and then came back
shortly telling me that it was o.k. to use it. Durring the beverage
service (it was a short flight) a second flight attendant came to me,
asking me what I wanted to drink, and said "What is that?" (refereing to
my scanner). I told her, and had to reasure her about 3 times that Yes,
I had checked with the Captain, and YES, it was o.k. to use, and YES, he
knew I had it.

I guess the moral of this story is _check with the captain BEFORE
the plane leaves the ground_.

<<<APPLAUSE APPLAUSE>>> ...

Newbies need to buy them from overseas and let the U.S. dealers sit on their non-modifiable heaps of trash! It's only when american business starts hurting that they will realize they either repeal the law or let the U.S. scanner business see a decline in sales.

I was reading the AOR-8000 uses plug in modules, therefore it may be possible to buy the cellular blocked model from EDCO/EBB when released and buy replacement module (contains the CPU etc) for an international version to get the full coverage. This was a good move!

Next, the OPTO-456 will permit cellular monitoring on ANY 2005/6, including any blocked in the CPU (IF they ever make any) as it bypasses the CPU and will permit scanning via serial interface to computer with cellular included. Not being a scanning receiver of four or more channels, more to the affect a third party kit, the FCC can jump in the lake at any attempts to regulate it. I hope to see the 456 made for other scanners, it would totally solve (ie kill) the problems of cellular lockout on base units as long as you have a computer nearby. I guess the stupid FCC had overlooked this situation -- not that they could have done anything to prevent it.

I'm a new subscriber to this group. There seem to be many postings about other pro models, but not this one. How come? Is it junk, or what? Any comments or modification ideas are welcome.

I really like this Silent Play gadget now that I've used it for a couple weeks. I've also used it to transmit the audio from my Pro-2006 so that I can listen on a radio in another room. This can also give the 2006 a great audio boost. I've also used it to copy part of a recording on a microcassette tape to a regular tape when I didn't have a cable. I'm sure there are other interesting uses for this thing. I tried to have it transmit my voice by plugging in one of those little microphones, but I could barely hear myself speak with the radio on full blast. Does anyone out there know why?

Also, am I breaking the law when I retransmit police from my scanner via this Silent Play gadget? What about NOAA weather, military, private aircraft?

On summer nights I used to hear stations in Elyria and Cleveland, OH coming
in on my local Macomb County 460 frequencies here in MI. I also have
icked up Los Angeles, CA in the 37 MZ band in late Fall. My mother's
scanner in Warren, MI really picked up the Los Angeles PD on the 37 MZ
band. It was just like being in the area. I haven't heard this
for several years recently. Is that because the skip in not good or what?
Augusta in MI

5599. Clearing memory on a BC-890XLT

Newsgroup: rec.radio.scanner

I used to monitor the US Forest Service repeaters 415.225, .325, .425.
Now it seems, they are using some other method. When I asked at the
local Los Padres main office they treated my request like espionage.
(We've owned land in the Forest since before it was the Forest, 1893)

Now, I know it's weed season and all that. But, where did they go?

Maybe I missed it, but did anyone mention searching the repeater
inputs? This would have worked great if you were close to the Bronco.
Just search 823-850, the cars only output 3 watts, would have been
easy to find him. Then add 45 meg to freq and you get both sides.
Would have been rough in the copter, his altitude would cause him to
get lots of car freqs. When they were parked in front of the house,
it would have been a snap, not a t-hunt.

5604. Buying a Used Scanner Radio

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. | Sonar even made a 24 channel unit, model FR-2513, in which | crystals were held in a rotary "turret."

The earliest scanners, like the first Bearcat models, did not provide individual channel lockout capability. Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM | receive capability, like the flamboyant turquoise Sonar | Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor

performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

More Modern Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by | General Research Electronics (GRE). Uniden began making | scanner models for Radio Shack in the late 1980s, and now | supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies

serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply. *

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but | lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and | display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems

including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up ad hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the

scanning circuits. You can find a TMR8H eight channel high | band unit most often.

TME series: The base versions of the TMR models. Both the | TME and TMR models share many common circuits but the base | versions contain speakers mounted on the front panel. The | most common TME model is the TME8 H/LM eight channel dual | band scanner in a metal cabinet with wood coloring. |

ACTR series: Replaced the Regency TMR units. By the time | Regency made the ACTR units, they no longer offered | different models for different parts of the 30 - 50 MHz | band. Look for the later ACT series, e.g., ACTR-106 (10 | channel tri band) or ACTR20/6 (20 channel tri band), used | light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The | ACTE and ACTR circuitry is similar, although the base | versions contain speakers mounted on the front panel. The | most common ACTE model is the ACTE8 H/L eight channel dual | band scanner in a black metal cabinet. |

WHAMO-10: Regency's first synthesized scanner. Appearance | more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every | feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but |
no aircraft. Easily programmable out of band. Built in
clock when radio off or in manual mode. Backlit keyboard
good for night viewing and mobile use but generates RFI
into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features |
only. Nice lit keyboard, but may cause RFI into nearby SW
receivers. Easily programmable out of band, but no
aircraft. All 30 channels are in a single bank, and lack of
direct channel access make this model more difficult to
operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different |
color and fewer channels. Nicely lit keyboard, but may
cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld
synthesized unit. Generous out of band coverage but no AM
aircraft coverage. Built by Azden. Very sensitive on UHF,
but annoying audio hiss leaks through speaker when
squelched. Belt clip chintzy, but can be directly replaced
with better clip from Kenwood TR2600A. Like the MX3000, all
30 channels are in a single bank, and lack of direct
channel access make this model more difficult to operate.
Low discount price makes this best choice for programmable
portable.

HX650/H604: 6 channel crystal portable. Likely made by
Sanyo. Same as Fannon and Bearcat Thin Scan units, (except
that Bearcat has 10.8 MHz IF frequency, and is harder to
get crystals for), but scans faster. Small size and common
crystals (available at Radio Shack), make this 1st choice
for bare bones portable scanner.

Radio Shack |

PRO2004: Top of the line, wide band scanner for 1987.
After a diode is cut, enjoy continuous coverage from 25-520
and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in
10 banks of 30, backed up by conventional 9 volt alkaline
battery. Any channel can be designated the priority
channel. Scans and searches fast. Lots of well designed
features, like 10 pairs of search limits, Lockout Review,
default search increment and emission mode. Sound Squelch
allows skipping dead carriers during search or scan. Metal
cabinet, good internal construction and shielding, but no
mobile mounting bracket or DC power cord. Soft touch
membrane keyboard. Good sensitivity and selectivity. Very
good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and
scanner of choice. Essentially a size reduced PRO-2004

with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. | Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or | provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a | front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit

room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer) |

4530: Japanese 10 channel crystal controlled 3 band unit. | Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition. |

Sonar: |

Sonar made several crystal controlled scanners and | channelized monitor receivers which shared the same RF | circuitry. Each radio was housed in the same size metal | case and worked on both 120 VAC and 12 VDC. The models | differed in the number of channels, the band coverage, and | whether individual channels could be locked out. |

Although they used a 10.7 MHz first IF, Sonar radios | require parallel resonant crystals different than the | common series resonant crystals used in Regency and Radio | Shack scanners. Sometimes, Radio Shack crystals will work | in Sonar units, but more often they oscillate a few kHz off |

frequency and are unsuitable unless changes are made to the |
oscillator circuitry. Therefore, beginners should avoid |
these radios. Typical Sonar squelch has long time constant |
causing a long noise burst at the end of each transmission. |

FR-104, FR-105: 6 channel monitor receivers covering 25 - |
50 MHz or 150 - 175 MHz. Manual channel selection, i.e., |
no scanning. Early models are identified by an 11 pin |
connector on the rear and they could be used with an |
optional NiCd battery pack and charger which bolted to the |
rear panel. Later models used Cinch Jones connectors with |
flat contacts. Optional tone decoder board. |

FR-2512, FR-2513: 24 channel versions of the FR-104 and |
FR-105 monitor receivers. Manual channel selection, i.e., |
no scanning. |

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. |
Recommend you avoid these models as there is no way to |
lockout a channel from the scan sequence. |

FR-2526, FR-2526, FR-2528: 10 channel scanners covering |
various combinations of 3 bands. Each channel could be |
locked out. Channel 1 priority. |

bn> they did.

Nah, never happen. Latest report in the Fido Scanradio echo, from a RS manager, is that there are no more 2006's in the warehouses. Several new triple-conversion units will make their debuts any day now (probably before the new catalog is officially released).

Over the past few years I have noticed that many flights have one channel on the radio (assuming they provide you with free headphones) where you can monitor the freq the pilot is using. Last week on a United flight they actually announced this and encouraged folks to listen in. One friend on the flight kept his earphones on for the whole flight and caught occasional traffic as we were crusing.

5609. AOR scanners - What is wrone with them?

Newsgroup: rec.radio.scanner
Date: 1994-06-26 15:29:09 UTC
From: scollin@sapphire.win-uk.net
Message-ID: <11@sapphire.win-uk.net>
Source record: 272561

I have just got started with Internet, but in the short time
I have been subscribing to this group I have noticed a distinct
disinterest in AOR scanners. No one seems to mention this brand
much. The only mentionings I can find so far are negative.

I am quite a fan of these radios. They are readily available here
in the UK and have good back up service via the importer. They have
good performance and even my old AR-3000 (AR-3000A predecessor)
leaves my ICOM R-7100 standing still as far as scan speed is
concerned. Is there something wrong with AOR scanners from other
user's point of view?

Any comments would be welcome.

Simon

5610. Re: Has anyone cracked Uniden 9100 900MHz cordless phone?

>: but spread out over about a 4 MHz range. I could tell when it was in
>: use, but no way to monitor the audio. I love it, and use mine at
>: work each day.

Note that 99% of the current cordless listeners (read: people with
plain old scanners) can't pick these up, but don't think that it's
secure - these cordless phones aren't really "TRUE" spread spectrum,
as used in secure military applications. They don't change their
frequency all the time, as they should to be secure. They tend to
pick a spectrum and stick with it. Therefore, someone with the
appropriate receiver could receive it pretty easily. (what do you
want to bet that a receiver could be made from another unit? :-)

When they come out with a frequency agile, DES-encoding cordless
unit, THEN it will be more interesting.

Steven...
From several RS people that hang out in CompuServe and Fido Scanradio,
this unit is being discontinued. On the horizon is a replacement that will
have 1000 channels, 100 / bank. Judging by the response of this unit, the
'2006 could be an excellent unit in holding it's value.
The new unit will also be cheaper in construction and have no cellular
modifiable capability. That's the word.

Maybe. Read the part about ``no evidence derived therefrom'', and about the legal doctrine of the ``fruit of the poisoned tree''. Something like that could very easily get the case thrown out of court, if the defense attorney knew what had happened. For that matter, I suspect that the prosecuting attorney would be obliged to tell the defense.

Well that dumb stupid RS employee has just created a mess in saying that.

Now since they have admitted there is no difference outside the unit, we need someone to purchase a new unit (with the changes) who also has an old one. You have a 30 day return policy on all RS equipment, no questions asked. Lack of cellular would be a good reason which could not be questioned.

Now, compare the new unit to the old unit, if you are real careful, you may even want to play with the diodes and see what happens to the scanner. Check and compare the CPU and other significant chip numbers, and TAKE NOTES!

Now, armed with these notes, call National Parts, ask them for the part number and the cost of the parts (that were changed, such as MPU/CPU), as yours inadvertantly got blown in a modification and you need to repair it. Use the chip numbers from the old, modifiable scanner. Now, post these results here for the rest of us. If I could find one of these new ones locally, I'd do it myself. So far, its all been hot air.

Think of it this way, if they have left the diode configuration in place, or hardwired it such that ONLY the CPU/MPU is blocking the signals, that is GREAT, since changing the chip would instantly unblock it, with no other "components" to change, move, swap, etc (ala Uniden).

Of course, if this is being used as a base scanner, the Opto-456 board installed and use of serial interface on your computer will always be able to override the CPU blockage anyhow, as it electrically disconnects and replaces the CPU when installed an operational, permitting you to search/scan from your computer. It costs $299.

Anyhow, back to dumb RS salesman, the reason I said dumb earlier, is any returned new 2006 units probably will have been probed, prodded, dissected, etc, prior to reassembly and return, meaning they will be selling used equipment for a while -- due to this stupidity. They might as well poly bag the changed parts - stamp a part number on the kit, and hang them on a peg next to the scanner shelf -- with a short "how to upgrade your new FCC approved scanner to cellular capability insert!". It would be illegal for RS to do the mods, ie, chip swaps, but NOT illegal to sell the components to do so.

I had one as my first scanner, that I've since sold. Radio Shack has discontinued it, but replaced it with a similar model in a fancy black box, rather than the 2024's tasteful imitation walnut grain. There was nothing wrong with it, if you didn't mind no 800MHz (I didn't) and only 60 channels (got to be quite cramped after a while). I never ran across any modifications for it.

5617. Best Cellular Scanner?

Newsgroup: rec.radio.scanner
Date: 1994-06-26 17:30:36 UTC
From: steven@sgb.oau.org
Message-ID: <Cs0Lz1.Hwu@sgb.oau.org>
Source record: 272571

I'm looking for some opinions on which scanner is considered the best scanner available for monitoring cellular phone calls. I already use a cellular telephone portable antenna -- which actually does help. I'd like to know which scanner seems to do this job best.

Please do not quote such items as "illegal to intercept, import, manufacture", etc... as I really do not care about such dumb laws and obviously do not obey them. Such trash as the April 26th stuff and the ECPA mean little to nothing to me. About the only aggrivation is Congress has forced me to go overseas for my monitoring equipment.

Anyhow, having said that, which scanners seem to do the best job for cellular monitoring? Keep in mind such discussions are NOT illegal, since I have been told by numerous people (in places where they should know), to enforce the ECPA, you must be violating it in the presence of a law enforcement official, or display of evidence of directly having done so, for example, making a tape, and playing that tape in the presence of a law enforcement person. Getting a search warrant on the grounds "you are suspected of listening to cellular calls" would be pretty hard to do, since turning the scanner off (something I normally do when answering the door) would kill any evidence they may have been hoping for.

BTW, WHICH congress members were responsible for this stupid law in the first place? Who do we NOT want to re-elect on the next election???

Actually the AR3000a is probably the best they have produced. But the older tabletop models (2515, 2800, etc) have had problems. But AOR has a tarnished name because of uneven quality control, problems with early versions of many models, arcane user interface, and lack of availability of service information. Here in the US, AOR was further tarnished by the reputation of ACE Communications, who used to be their exclusive distributor.

Because of the above, there are few mods/upgrades around, and people like Bill Cheek won't touch 'em.

I've owned AOR/Nissei scanners. They have lots of features and good performance, expecially for their size and price. But they've made some turkeys, too. And it's that uncertainty, perhaps, that keeps people away.

IMHO the unblocked PRO-43 has the best combination of scanning speed,
sensitivity, skipping over data channels (data squelch), and proper
bandwidth to produce non-scratchy audio.

Of course, I don't actually =use= it for that.

I am really happy with my AOR-3000A. I am even happier with it because I
got it in Hong Kong and didn`t pay Ace a penny.

Keep in mind that for every unhappy post concerning some product, there
could be 10 - 100 satisified users. The satisifed people rarely resort to
broadcasting their happiness. They are to busy having fun!

I am not a lawyer and suspect you are not one either, but I would be inclined to agree, barring evidence to the contrary, that such discussions are probably okay. I'm not sufficiently knowledgeable to pick a winner. One thing I've noticed is that many so-called cellular restorable scanners have only 12.5 MHz steps in that region.

You may disagree, I may disagree, many may disagree, but the law is the law, like it or not. It is inappropriate--some might say dangerous to the continued existence of the newsgroup--for a cadre of individuals to use USENET to admit publicly to flouting the law and imply others do likewise.

If this is a flame, it is a flame against the position, not against the poster.

Radio Shack sells a leather-ette pouch type case that works well with the '43. It doesn't give access to the keypad, but the belt loop is securely fastened. I've got one, and it cost about 10 bucks. Sorry, I don't have the part number, but it should be VERY common.

Oh yeah, I think they've got two different sizes, and the smaller one is the right fit for the '43.

Hold it there! For your information, *millions* of Americans visit
Canada every year. Over here you can listen to cellular calls 24
hours a day if it makes you happy, legally. Just remember *not* to
discuss what you hear with anyone except the parties whose
conversation you heard.

Why is it inappropriate, much less dangerous? In the first place, how does anyone know that the person making the claim is actually doing so? How do we know the postings are not forgeries? How would it endanger the existance of the newsgroup?

I suspect that, if a few hundred thousand people up and stated that they listen to the cellular frequencies, that the ban would be ignored as unenforceable - which is exactly what it is. The only way that the cellular industry will secure conversations is to go to either a random root digital encryption, or a varying spread spectrum transmission.

Can't answer for him, but I have seen ads for ham power amplifiers
for export only

Ham radio gear in Canada, if one shops carefully, is a little
cheaper than it is in the US, with the possible exception of Alinco
products. On the other hand, scanners tend to be a lot more
expensive. I imported mine from the US. Canada, which is visited by
millions of Americans every year btw, has no restrictions on
monitoring cell frequencies, as long as one keeps quiet about what
one hears.

It is one thing to discuss electronics, theory, and what-ifs. Not a lawyer, just an engineer, it seems in the US we are free to assemble electronically to discuss ideas, theory, and even challenge the legal system. BUT it is legally dangerous to admit openly that you are breaking the law. A newsgroup is an open discussion. Those who are wise will continue to discuss ideas as theory.

Then again, what the heck do I know.....just a mere computer engineer in the big world trying to do the best I can (and not doing such a good job half the time!)

>line of reasoning.

Perhaps someone with a better understanding of the law in Canada might explain this. It was my understanding that the medium in Canada does make a difference. When I send a letter via Canada Post the medium used (e.g. the envelope, the trucks, etc.) is private even if Canada Post is publically held and regulated. Similiarly if I my telephone conversation is carried by wire (coax, fibre, etc.) then that medium is private, even if the telephone company might be government controlled or regulated. However, radio waves are considered public. This would be more like someone using smoke signals to send messages from one end of Saskatoon to another. Now consider a law to regulate the technology to decode this message (i.e. the knowledge of how messages are encoded into smoke signals) or a ban on reception (i.e. don't look at the smoke signal).

I thought in Canada the current law permits monitoring radio personal communications as long as there is no personal gain and you do not repeat the message. However, for some reason it doesn't seem to be applied; anyone know why? I note that on the highways of Toronto there are many tow trucks on the highway, each with many scanner antennas installed, monitoring cellular and other frequencies for business. I note that in British Columbia a political figure got in trouble after newspaper reporters published a cellular conversation which implied an extra-maritial affair.

Of course, as a user of cellular phones I accept that my calls can and are monitored. And I accept that my cellular phone company sends something to my car phone which makes it announce its location, even when I am not on the phone, allowing anyone with a bit of equipment to chart my car's every movement.

I like the BC2500XLT because of its speed, but by far, the best way to go is a computer controlled scanner like the R7000. I have all input and output frequencies programmed by wireline & non-wireline, with 7 cell (A - G) groupings and 21 cell (1 -21) groupings. Random searching just doesn't cut it.

> to see the FCC frequency licenses issued to the station?

As a radio license manager, I can comment point blank: none.

* Law requires posting of license at control point, and access to
license by FCC officials.
Law does not require public access to control point or to posted
license.

* Radio license applications, unless a matter of state security, are
a matter of public record.
Public access to record information is available through the FCC.
Access to a specific licensee's license is available by
filing a lawsuit or obtaining a court order.

This may sound difficult but that's the way the law works.

People should note that a lot of long distance telephone traffic is
sent via point-to-point microwave, so it is "public" according to this
argument. The difference being that you can't buy a cheap box to
eavesdrop with. Also, the oncoming wave of high-bandwidth telephone
technology is wireless, which is to say that fibre is now old hat.

Anyway, this could probably be fixed with appropriate encoding.

> Sounds like an acceptable cordless for me... What is the price range
> on this beast? How long does a charge last? How about range?

The 9100 is/will be selling in the $270+ range shortly.
I purchased the 9200 (2 line) through the Shoppers Advantage
(1-800-835-7407) for $305!! You have to "join" their club ($1.00 for a
trial 3 month membership $49.95/yr after that) The best price I had seen
for the 2 line phone was $399 in the DAK catalogue.

The ONLY thing I don't like about the 9200 is there is a slight echo in
the earpiece when talking. The other advantages far outweigh this slight
fault. (I was told by the factory that the echo was because of the
spread spectrum technology).

I too, have tried to scan this radio and have received nothing!! The
distance is also greatly increased.

The 9200 comes with a battery charger (in addition to the charger in the
cradle) which accepts an additional battery ($36-40..from Uniden If I
remember properly) it serves the dual purpose of having an extra battery
ready for those extended calls and powering the base unit should there be
apower outage.

The 9200 also allows you to make/recieve calls even if the handset is not
at the base unit.

All in all....I LIKE IT......

(not affilliated with UNIDEN or Shoppers Advantage..)

>keep worrying about the battery?

You can do a direct wire, but you will need to put in a voltage regulator. Car power can range beteween 10 to 18 volts during operation. You will want to limit the voltage going into the scanner to about 14 volts. Keeping the battery pack plugged in would also work as a "regulator" but the battery probably won't last long that way.

For the same reason that it would be inappropriate in *any* newsgroup to openly flout the law and encourage others to do likewise. The newsgroup might be viewed as fostering illegal activity. If some can't see the problems posed by a newsgroup where posters openly speak about committing illegal activity in the area/topic to which the group is dedicated, I'm afraid there's little I can say to help. But if I were personally involved in enforcing of those laws, I'd do all I could to restrict, by any legal means at my disposal, any group that promoted illegal behavior.

Again, I'm not saying the law shouldn't be discussed. I'm firmly in the "it's my body your passing these signals through" camp. But trying to change a law by public admissions of breaking it is not without risk.

5645. balloon tragedy in Illinois

I read this group all the time and wondered what the
excitement would be in monitoring hot air balloon traffic
until Saturday when I heard the Geneva, IL police say
that the Maxwell House Coffee balloon was in trouble.
There was a festival launch Saturday morning and the balloon
hit some wires while landing. The crew got dumped 30 feet
to the ground and the balloon went another 7 miles unmanned
with its propane tanks burning until it crashed into some
trees. I just heard the police side of it, but can imagine
that listening to the crew would have been "exciting" to
say the least.

The crew is expected to recover from their broken bones.

Kinda gives new meaning to the Maxwell House slogan "Good
to the last drop".

|Again, I'm not saying the law shouldn't be discussed. I'm firmly in the
|"it's my body your passing these signals through" camp. But trying to
|change a law by public admissions of breaking it is not without risk.

Sometimes the assertion of "rights" in the face of government edicts
is what people need: Courageous Leadership.

There's one NRA Director, TJ Johnston, who advocates widespread
disobedience of California's semi-auto (so-called "Assault Weapon")
ban, who openly flaunts the law. So far the CA government has left
him alone.

Sometime the government will recognize the futility of enforcing
laws in the face of widespread flaunting of it; recall that once,
27 Mhz Citizens Band transceivers required users to be FCC licensed;
the onslaught of massive non-licensed use caused the FCC to drop
the requirement; no way in hell they were ever going to get those
millions of CB set users licensed...

The assertion of "rights" shouldn't automatically be discouraged
because of the implicit threats of governmental action. Remember, a
bunch of fanatics were instrumental in the formenting of the Republic...

Chris,

Fiber, old hat? Fiber still has greater b/w than microwaves. Fiber hasn't made rounds here in the USA due to federal restrictions, that's why we're 10 years behind Europe and the third world. Light waves are higher frequency than radio waves, thus your agregate b/w's will always be higher. The restricting feature of fiber as far as our federal government is concerned: less prone to wire-taping. The clipper chip will take care of this...

From: pdennis@vnet.ibm.com
Message-ID: <19940627.125711.213@vnet.ibm.com>
Source record: 272459

I don't recall seeing this here before so I thought I'd post it. If
anyone knows of harm that this can cause please let me know!

Yes, I know that the PRO-51 cannot be modded to get cellular, but
I found out this little tid bit today and want to pass it on. On
BOTH the PRO-46 and PRO-51 you can load a set of test frequencies
one of which is cellular. From this frequency you can manually scan
up and down the cellular region.

NOTES:

1) THIS WILL CAUSE ALL OF YOUR CHANNELS TO BE ERASED!!!!!

2) I do NOT know if any damage may occur by doing this. It was demo'd
to me at a local radio shop (NOT RADIO SHACK) on a PRO-51 and it also
worked on my PRO-46.

Very simply you hold down the 2, 9 and L/O keys while powering on the
unit. It loads thirty frequencies in the banks 1-3. Channel 23
is in the cellular frequency range (888.???) and you can manually
go to channel 23 and then direct scan up and down from there.

Once you scan into the regular scan range of the scanner (894 Mhz or so)
you cannot get back into cellular without manually going to channel 23
and starting over.

If I understand this thread, the Canadian Government's National Information Highway Advisory Council is considering (or may have already) recommending the criminalization of monitoring of certain radio waves, and banning the importation or manufacture of digital scanners. The current questions are about the existing (pre-recommendation) situation.

In article <2um3rm$833@scapa.cs.ualberta.ca>,
Chris Shaw <cdshaw@cs.ualberta.ca> wrote:

I am not sure what you mean by "public". I simply said that I thought that in Canada they could be monitored legally as long as the information wasn't used for personal gain or shared with anyone else. For example, I believe anyone can go to Radio Shack and buy a shortwave radio for under $100 and then use it to monitor ship to shore phone calls legally. Or you can legally listen in to cellular phone calls by tuning your old TV set around channel UHF 83. Perhaps someone with more knowledge of the law can clarify these legal issues.

Actually another question I have is what does current Canadian law say about decoding satellite TV (such as pay-per-view, CNN, etc) without paying? I thought it was illegal. If so, under what law, and why can this not be extended to other services?

>
>Anyway, this could probably be fixed with appropriate encoding.

I agree--If its my cellular phone (or general wireless) communication, I would rather rely on tilting the encryption versus cost balance in favour of the former--keeping in mind that those with enough money (e.g. governments, large corporations, crooks, etc) will always be able to listen in.

5656. Weather Satellites?

^^^^^^^^^^^^^^

Point to point microwave may use the upper radio-frequency bands to
transmit information but it is NOT *public*. Point to point means
just that: It isn't broadcast into the homes and workplaces of
everybody within an X km radius. Because of this, it is a private
information medium and not subject to the same types of
regulation. (Two "side by side" microwave reciever/transmitters may
use the same carrier frequency with interfering with each other.)

> argument. The difference being that you can't buy a cheap box to
> eavesdrop with. Also, the oncoming wave of high-bandwidth telephone
> technology is wireless, which is to say that fibre is now old hat.
> Anyway, this could probably be fixed with appropriate encoding. --
> Chris Shaw University of Alberta cdshaw@cs.UAlberta.ca CatchPhrase:
> Bogus as HELL ! http://www.cs.ualberta.ca/~cdshaw

It's not the bandwidth that makes the difference, it is the method of
transmission. The important distinction is "Is it broadcast, or is it
sent?", AM, FM, shortwave, cellular phones... all (at some point)
are broadcast. Mail, point-to-point microwave, (most) satelite
signals, fibre-optics... are sent to only the intended recievers.

Now, a particular broad-band media service may be declared to be
"public". Internet, and possibly the currently evolving "Information
Superhighway" are examples of this. But that is different story
altogether...

Cheers,

Doug

I just spoke to OptoElectronics (The Makers of the OptoScan 456) and
they tell me that they have someone working on a Mac based S/W for the
board. So all us Mac uses will soon be able to control our 2005/6's..

I am also told that the interface is RS232, so basically any Computer
can control your scanner. You just need to write an interface for it.

>Chris,

>Fiber, old hat? Fiber still has greater b/w than microwaves.

Yes. Fibre is getting to be old hat at the bleeding edge of technology,
and digital wireless is the new R&D interest. Fibre has the significant
disadvantages that you must string it over difficult terrain and that it
can be cut. This is what my telco friends tell me, anyway.

I think there are better reasons than the NSA for the reletive
non-proliferation of fiber in the USA, like the large installed base of
copper and/or microwave, and "deregulation" in the 80's.

: admit publicly to flouting the law and imply others do likewise.

: If this is a flame, it is a flame against the position, not against the poster.

In response, I will simply say -- distribution of information on how to monitor, where to monitor, what frequencies to use, what equipment you use, where you can purchase it, makes no legal difference. It is the actual act of application by the user that is the violation, not the information on how to do so. Call it flouting if you want, it is 100% legal to talk about it -- how a person uses the information is another story -- and its also 100% legal to own and possess such equipment.

If you think there could be something wrong here, you have obviously never visited alt.2600. Try it sometime, every known method of making a red box to a tunable cellular telephone can be found there, and many more questionable how to's, its like the darkside of the telecom area.

Something you may wish to try:

If you are trying to FTP into a machine (i.e. garfield) and get rejected,
replace the machine name with 'ftp' (i.e. ftp.catt.ncsu.edu).

This way, if the ftp site moves from one machine to another, 'ftp' will
mask the machine name, and you will not have to keep track of what
machine it is on.

ftp.catt.ncsu.edu works.

I am in the market for an outdoor antenna for my scanner. I
would like to know if anyone has any suggestions. There are two models at
radio shack for about 50-60 dollars, also I saw some units in Grove and
Tucker for sale. Also what is the best cable to run between the antenna
and the scanner. (which size) The total length would be around 60 feet.
Thanks for the info.

Nothing in the current law (ECPA or otherwise) makes it
illegal to have the cellular frequencies programmed into
your scanner. The law prohibits listening to cellular
frequencies...and having cell frequencies programmed in
your scanner wouldn't (IMHO) ever be enough evidence to
convict anyone of actually listening to cellular.

The Oregonian newspaper reported today that the Penske radio transmissions were unscrambled for the Portland GI Joe's 200. "When Roger Penske decided to scramble his Marlboro Team Penske signals this year, he received so many letters of complaint the scrambling was finally stopped in Portland."

Unfortunately, I believed the folks at the scanner rental booth who said that Penske was still scrambling so I never bothered to program the frequencies into my scanner. There are probably multiple lessons to be learned here. Double darn.

Regards,

Mark

>such electronic equipment, even if the company policy states otherwise.
>
The pilot IS IN CHARGE! and any electronic can cause interference to the
nav systems. The VOR antenna of most airliners is on the tail of the a/c.
This restriction applies to a wide variety of electronic equipment such
as laptop computers, radios, scanners and cell phones amongst others. The
Flight Attendant probably was told that the scanner could cause interference
to the a/c VOR equipment, she probably misquoted the Captain. Personally
I am a avid scanner fan....BUT I would rather forego using my scanner on
an a/c if it was going to cause a problem...I would suggest if you don't
like this restriction, you can take the train! (grin)

[edited]

From what I've read, newer planes such as the Airbus A320 and the
Boeing 777 have computerized flight controls, too. Yeah, messing up
navigation would be bad, but sending the plane into a nose-dive would be
a real bummer.

In my last phone bill was a leaflet on Caller ID that warned that my number may be available to the receiving party if I call 700, 800, or 900 numbers. I believe that this has always been the case, long before Caller ID was generally available. Also, this info cannot be blocked by Caller ID blocking.

Ain't no such thing as a free phone call!

I was also concerned about protecting the casing of my new PRO 43 scanner. I went to the local fabric store, bought some black vinyl and made a case. I made cut outs in the case so the display would be visible, and hte keyboard accesible. I installed a clear plastic material over these cut outs so the display and keyboard would be protected. I'm not a professional sewer by any means, but the end result was pretty good.

> reception, but if your cells are not too crowded it's no problem.

You misunderstand the intent of the law. The law was created to placate
the cellular telephone users, that heard that their conversations could
be listened in on. Now they can feel secure in the knowledge that it is
illegal, so therefore their conversations are safe from prying ears. The
cellular industry doesn't give a rats ass if anyone is actually listening,
as long as they can convince their customers to *FEEL* secure and revenues
aren't affected. The law was created to give the impression of security,
and that is all that is required from the law. Now that you can't buy a
radio that can receive cellular band, cell phone users are happy. The
fact that it will always be possible to modify a radio to pick up cell
calls until they go to some sort of a keyed encryption system isn't
germane to the issue. Ignore the man behind the curtain and everything
will be OK. It will remain so, as long as profits aren't affected.
Well I'm down off my soap box now.

Good listening

: : since it not "could" but "will" affect your business activity sooner
: : or later... I think Opto Electronics helped you out -- as I read a
: : rumour you were going to carry the Opto-456 which can override the
: : cellular CPU lockout when under computer control.
: :
: : Thankfully, the FCC has NO jursdiction over the capabilities of
: : personal computer software distributed on disk!!!

: No, but they could consider that to be "readily capable of modification".
: The interpretation is left up to the FCC. As such, they could remove the
: certification of the 456, and will - if there is enough noise made about
: it. I suggest that Grove and Opto tread very softly here - or we will
: lose yet another scanner.

That would be true except as a class b computing device, none of
the cellular trash-like rules apply. It is NOT a scanner capable
of four or more channels. On its own, it is also NOT a receiver.

He hee... don't mean to be offensive here, but I saw someone wearking one of them--it looked soooo funny! I guess it could have been the RS sales person who looked funny, but I got the impression he was trying to impress the customers by carrying the ht/scanner on his belt. Hmmm. . .I don't remember seeing any antenna sticking out though. I actually looked at the case that my local store had and it was obnoxiously large and awkward looking (IMHO). If I were to get a case, I would probably buy one the next time I go to a ham fest. The ones you find there look a lot more professional.

My company was pushing the fiber issue along w/the rest of the fiber
competition and the attornies (yes, lobbies) found that the Fed Govt
was the main blockade, not the copper issue as was popularly believed.

Modern cable is encased in kevlar jackets, which in turn is encased in
a jacket suited for the particular environment (in Hawaii, our installation
was wreaked by rats which had a taste for the jacket we use at the time).
As a matter of physics, light is at a much higher freq than RF, yes?
The total b/w's will always be higher. Microwave is the least expensive
but unfortunately is b/w limited and freq's are becoming cluttered. Now that
there are alternative methods for tapping f/o comm's, f/o installation
is happening. Maryland is wired for single mode f/o thanks to the cable
companies and the teleco's are planning to lease b/w's from them. NJ's
been wired for years now and have been implementing some of the best
performance protocols to date. The next hold up here is the industry
is waiting for the US Gov to cut the checks to fund the 'Info Highway',
we'll see how long that takes...

hi everyone, does anyone know oof any mods for the rat shack pro-42 scanner?
any and all mods...the most wanted one is a mod for the 800mhz "business"
band.
thanks all, and if you know anyone who does mods on them let me know! thanks!

5690. Cell Phone Hand-off

Newsgroup: rec.radio.scanner
Date: 1994-06-28 03:30:32 UTC
From: dwhansen@panix.com
Message-ID: <2uo5go$909@panix.com>
Source record: 272436

Question:
When a cell phone hands the call off to another cell, how can I tell which new frequency the call was handed off to. More clearly, can I decode the data portion and follow the call without having to scan for the caller's voice on other frequencys. The cost of such a system is not an issue, I am interested in HOW I might go about this.

Thanks... David W. Hansen

Message-Id: <26SEP199310482172@erich.triumf.ca>

Channel 16 (distress and calling) will be quiet, except when pleasure
boats are
active. Commercial vessels rarely use it except to make "safety"
broacasts as
they approach narrow channels, etc.

Commercial vessels will normally communicate with a Vessel Traffic
Management
Center, reporting their position and intentions at specified
calling-in points.
Traffic will then tell them what other vessels they should expect to
meet.
Vancouver Traffic uses channels 11 and 12 locally, and Seattle
Traffic uses 5A
in Puget Sound.

Weather Channels: (as in Icom IC-M55)
Wx1 162.550
Wx2 162.400
Wx3 162.475
Wx4 161.650 Marine 21B - CCG West Coast Weather Broadcasts
Wx5 162.425
Wx6 162.500
Wx7 162.525
Wx8 162.450
Wx9 161.775 Marine 83B - CCG Great Lakes & East Wx Broadcasts
Wx10 163.275
(Wx5 - Wx10 are not listed in the manual, but are in the radio)

The channel usage marked with an asterisk (*) are from tables in Icom
IC-M2
and IC-M55 marine radio manuals, and are probably fairly "generic",
and
subject to change in different jurisdictions. Other channel usage is
from my
station licence for the Canadian West Coast, and from things
overheard on the
air. "Your usage may vary."

Channels marked (CCG) or (USCG) are for Canadian or US Coast guard
authorized
stations only.

Channel 70 is supposed to be reserved for a future selective calling
distress

and safety system, but is (illegally) being used for intership communications
(even by the RCMP!)

The letters under "area" mean:
I: International only (non-US) according to Icom
C: Canadian usage
A: American usage

Channels with an "A" suffix are simplex operation on the ship transmit
frequency of an international duplex channel.

Canada uses a "B" suffix to denote broadcast (one-way) use of the shore
transmit side of an international duplex channel.

There are no repeaters (as hams know them) in the marine service . If you
are willing to pay for a phone call, the telco might let you place a call
to another vessel on the same (or different) channel, and so get the effect
of a repeater.

: > of the newsgroup?
:
: For the same reason that it would be inappropriate in *any* newsgroup to
: openly flout the law and encourage others to do likewise. The newsgroup
: might be viewed as fostering illegal activity. If some can't see the
: problems posed by a newsgroup where posters openly speak about committing
: illegal activity in the area/topic to which the group is dedicated, I'm
: afraid there's little I can say to help. But if I were personally involved
: in enforcing of those laws, I'd do all I could to restrict, by any legal
: means at my disposal, any group that promoted illegal behavior.

So, I cannot control what people post. It is the same as drunk drivers, I have no control over their actions either. Should we take away the privilege of driving automobiles, just because some people abuse that privilege? If not, then why would there be any danger to the group?

Well, when you get the right to restrict freedom of speach, then you probably can play "correct speach nazi" to your heart's content. For now, it is not illegal to post such information. In most countries outside the US, it is not even illegal to listen to cellular frequencies.

: Again, I'm not saying the law shouldn't be discussed. I'm firmly in the
: "it's my body your passing these signals through" camp. But trying to change
: a law by public admissions of breaking it is not without risk.

Not much risk. The FCC does not care one whit whether you listen, or not. They do not have the manpower to enforce even more important laws, much less this idiotic one.

Have you ever tried to trace a forged post? It would be extremely difficult for you to tell if my posts actually are from the site in the header. It would require a court order - plus cooperative system administrators.

Not really. Try to obtain a firearm there - or, I believe the ban is still on, so-called pornography. The most recent paranoia I encountered was their concern about "switchblade knives". They did not even ask me about firearms, the last time I traveled to BC.

So, both countries have problems. Neither will be "free" until the governments decide to get out of the job of running the personal lives of the populations.

: I am looking for a carry case that has a belt clip on it. It's for a Pro 43.
: I live in Ontario.

If you live near any large discount stores, look in the camera dept. I found a nice padded nylon camera pouch that fit my PRO 43 perfectly. It has flap that covers the top, and a belt loop on the back(with a large lower snap). It has an elastic loop on the under side of the lid for holding a roll of film. Detach the upper elastic connection and fold it over the the radio top, attaching it to the lower velcro. This will hold the radio in when the lid is up. I found my case at Wal-Mart for only...$4.98! They get sold out and restocked, so they must be an item that is normally carried by the store. This is the first case I've found that is a nice fit on the radio, and at this price, I may get another to customize! Till later, Si B.

I'm planning on spending a few days on the cape over the holiday weekend and would like to listen in on the local activity while I'm there. I'd appreciate it if someone would post or e-mail any frequencies they've discovered in this neck of the woods (particularly around Chatham).

Thanks !

I posted this, saw it on the list, yet it isn't there two days later. So waht gives? Is this some kind of moderated list, and my question was out of line? I'll try it one more time: what do you scanner people do about the Motorola scrambled phone?

> probably won't last long that way.
>

Be carefull...

Input into battery pack = 12v
Input into BC200XLT from battery pack = 7.2v

Don't direct wire your car battery into the BC200XLT, if you
do **BANG**.

As Brett says 12v nominal into the battery pack will be OK - it
won't do any harm in the short term but over a period of time
it may not do it much good either, just make sure you use it from
the batteries on a regular basis so they get "cycled" (sp?).

I WILL R E P E A T WHERE IS IT AGAINST ANY LAW TO DISCUSS, DEBATE, EXCHANGE INFORMATION ON EQUIPMENT, SOURCES, MONITORING OF, THE FREQUENCY RANGES OF CELLULAR MONITORING!?!?!?

The law deals with the listening and reception OF, not the how to, where to, when to, etc. Since the law PERMITS POSSESSION OF, and the EXCHANGE OF INFORMATION is NOT ILLEGAL, please may I ask, WHAT IS YOUR PROBLEM?

I could state I rob banks for a living, guess what, I can legally say that. Now if someone wishes to try and PROVE so, that would take more than just the statement made above. If I were in a jury on the ECPA being broken by someone due only to statements that he/she made stating he/she does so, I would have a hard to to prosecute that case without some live witnesses who had also SEEN AND HEARD monitoring activity being performed FIRST HAND.

I think it's about time we attracted some of our U.S. constitutional friends and supporters of civil liberties over here (if they have not already got here).

I believe the law specifically states specific frequency ranges not to monitor. That law specifically directs a specific action, the ACT of MONITORING. Now, it does NOT state you can not discuss HOW to do it, and we DO have CANADIANS here -- where this legal garbage has no meaning anyhow. Where in ANY of the cellular laws does it state "Thou shalt not speak of this, discuss equipment for transgressing of, discuss methods of import or modification for transgressing of", etc?

: a cellular capable scanner, and walk back into the states w/it if he
: gets away with it thru customs? Unbelievable...

CORRECT! PAY THAT MAN, HE JUST WON!

Can someone tell me what the North American Free Trade Agreement is all about? I mean, more specifically, when does it take place? It's my understanding, that if they really mean free trade, this means you will merely pass through customs for purposes of identification, with no checking or interest as to what you are carrying, hence the term FREE TRADE. I mean they may have the drug sniffing dogs around, but as per looking at what you have and assessing duties based on those goods, sounds like it would be in violation of a Free Trade Agreement.

Can someone fill me in one what that "agreement" means?

Also, if needed, you can mail the instructions, box, etc back into the U.S. (not against any law to send packing materials for cellular scanners), and simply state it came with you (along with the camera and binoculars) on vacation. There is no reason to doubt the claim.

Or, you could also say "oh, it needed repair, I just picked it up". Or if you really want to do the job right, you "prepare" a receipt showing U.S. made purchase from a U.S. based dealer (knowing they never check such things), carry it over the border, carry the scanner back -and- if challenged, you produce receipt showing bought in the U.S. That should satisfy even the most curious. The receipt could even be a personal receipt made by a U.S. located "friend" with whom you made a purchase of a "used" scanner from him prior to the

trip. In any event it would show you had it before entry, and they would have a hard time proving otherwise.

I know this is getting off the subject, but my theory is that after the Rodny King event, the police wanted to be extra careful when they arrested OJ to avoid public outcry (riots). On the other hand, being so careful could allow OJ to get away. Thus, lots of police and no real action.

Source record: 272456

I have two cellular related questions that I'd be grateful if someone could answer.

(1) Is it common for a conversation to change frequency while the caller remains in the cell?

(2) I would guess that
the reason a call changes cells is because the caller is moving. If one is not near the boundary of the new cell, wouldn't the signal from the new cell be too weak to copy most of the time? I'm guessing that even though the same frequencies aren't used within adjacent cells, the signals can't be too strong lest splatter or unwanted capture occur. Thus, is there any point to trying to follow a conversation across cells if one
is not mobile or using high gain, directional equipment?

Just curious. Thanks.

: Boeing 777 have computerized flight controls, too. Yeah, messing up
: navigation would be bad, but sending the plane into a nose-dive would be
: a real bummer.

Not just that the controls are computerized, but you actually "fly by wire".
Meaning, that instead of pulling a control that is actually attached to
hydralic (sp?) equipment that in turn is tied to the flaps and such, you
are pulling on a joy-stick that is read by the computer. The computer then
sends control signals to the hydralic equipment elsewhere in the plane.
Any electro-magnetic interference (EMI) could screw up this signal.

After all, a man was once KILLED when a ladle on an overhead crane poured
molten steel on him accidently because of EMI!

There is no moderation here. Every news feed keeps its own messages on disk.
The problem may just be that your site dumps old messages as new ones come in.

Moto uses speech inversion on their phones. You can get a speech inversion
kit to decode, or try the SSB tuning method. I recently ran across an
inverted conversation and tried the SSB method on my R7000, but they hung up
before I could fine tune, so I don't know how well it works.

EEB is the AOR distributor for the USA and is trying to get FCC approval. The
only hands-on report I have seen was a guy that worked for EEB that said he
played with it for a few hours. Unfortunatly, he didn't have much
constructive to say except that he didn't notice any problems. He didn't have
the instructions with him, so he didn't use many features.

If it has good RF performance, I'll be selling my wife's car to get one. :-)

>
>Good listening
>MAD

Not to bring up a topic that was pounded almost to death around the
time that the proposed legislation was being discussed, but I think
that there's a bit more to it than just keeping cell phone users
"secure". My memory may be a bit fuzzy, but I recall that a survey by
(some party) suggested that the majority of cell phone users aren't
all that concerned that their calls aren't very secure. The ones
(e.g. corporate users, military) who are probably have had scrambling
systems in place for quite some time.

The impression that I got was that the entire "oh gosh, our 'phones'
can be 'tapped'" emphasis was a red herring invented and publicized by
the cellular providers in order to help railroad the legislation
through. (It helped especially considering the fact that your average
political bureaucrat probably shudders at the thought of his
conversations being overheard.) Sure, one now can't legally listen to
cellular conversations _per_se_, but as I recall the ban does not
specify the conversations, but monitoring the *cellular frequencies*.
Correct me if I'm wrong, but up until now no organization in the U.S.
has had frequencies "given" to them: these were "assigned" by the
FCC (and related entities), and could be removed at a later date. The
cell ban, by specifying the exact "cellular phone frequencies" that
can't be monitored in effect gives them to the cellular companies.

Sure, one might argue that the probability of the frequencies of, say,
the VHF television stations being reallocated is pretty slim. The

problem is not really with reallocation as it is with legal precedent
and with blurring of responsibilities between Congress and the FCC.

Thems who has the bucks makes the rules ...

The original idea of reporters gathering information from scanners revolved around listening to the scanner for information about an accident or a crime then, following up with a telephone call to the fire station or police station to obtain more details if they were available at the time. Or, they would first hear a call being dispatched on the scanner and then travel to the scene of the incident to obtain more information from investigators or PIO personnel. But, the idea of deliberately recording scanner trafic for re-broadcast sounds preposterous. Happy Monitoring...Brian.

mike_diaz@smtp.esl.com (Mike Diaz) writes:

>You misunderstand the intent of the law. The law was created to placate
>the cellular telephone users, that heard that their conversations could
>be listened in on. Now they can feel secure in the knowledge that it is
>illegal, so therefore their conversations are safe from prying ears. The

Problem is, the law was NOT needed! Section 605 of the Communication
Act of 1934 already made it illegal to divulge contents.

>cellular industry doesn't give a rats ass if anyone is actually listening,
>as long as they can convince their customers to *FEEL* secure and revenues
>aren't affected. The law was created to give the impression of security,
>and that is all that is required from the law. Now that you can't buy a
>radio that can receive cellular band, cell phone users are happy. The
>fact that it will always be possible to modify a radio to pick up cell
>calls until they go to some sort of a keyed encryption system isn't
>germane to the issue. Ignore the man behind the curtain and everything
>will be OK. It will remain so, as long as profits aren't affected.

No, it is NOT ok. Personally, I don't give a rats ass about listening
to peoples boring bullshitting on their cellphone. I am dreadfully
concerned that this law has set a precedent that will allow ANY and
EVERY special interest RF user to attempt the same thing, to wit, make
it illegal for you to listen to that frequency. Combine that with the
idiotic "spectrum auctions" and you have a REAL potential problem.

The law needs to repealed, and cellular manufacturers, sellers,
and users told that if they want security, THEY should pay for it, NOT
the rest of us! Let them pay for digital encryption, and if they bitch that
they were lied to and told the phone was secure, make the COMPANIES pay
for it, NOT the rest of us!

>Well I'm down off my soap box now.

Well I'm NOT. Not by a long shot. These alleged privacy laws on
the PUBLIC airwaves smack of naziism of the worst kind. This isn't about
simple "political correctness" (which is bullshit anyhow), this is
about doing real damage to the citizenry. It is about the corporate
buyoff of public resources and congresscritters. It is a wakeup call
for reform of our governmental offices and officials. It has to START with
you and me screaming bloody murder to those congresscritters and exercising
the ballot box where needed.

Duane

Jerry Dallal (jerry@hnrc.tufts.edu) wrote:

: (1) Is it common for a conversation to change frequency while the caller
: remains in the cell?

As I understand it, calls are constantly switching frequency both between cells (from one to another) and within cells. The switching within cells is at least partly to average the load, I'd guess, but I don't know this to be fact. I'm sure someone more familiar with the system can provide a much more detailed explanation.

That is, in fact, why I bothered to add my small input... I have a question I wanted to slide into this thread before the experts get involved. :)

I'm in the Chicago area. When I scan the cellular band, being carefull to stay in the freq. range for bases and not mobiles, I generally do not hear the mobile side of the conversation. It would seem that either:

a) I am clue-less. :) (It -is- my first scanner, and only 2 weeks old at that.)

b) The cellular carriers in my area no longer have the base repeating the mobile signal, as I thought was standard practice.

Can anyone offer input on this?

Thank you.

Dave

Here's where I got the freqs to scan. I think this info is correct.

>Bill

The following was posted by CSI, and you can find a write-up
on the device in the Aug. 93 issue of Nuts & Volts.
It is about $500 CND.

edward@cs.ualberta.ca

PS: I live in Canada :) so....

CELLULAR SURVEILLANCE INTERFACE TEST SET

The Cellular Surveillance Interface (CSI) decodes the data transmitted on
cellular control channels. It interprets the data as cellular commands,
displays it on your PC screen, and tunes your radio.

The CSI will work on cellular systems in North America, Europe, the Middle
East, Southeast Asia, Hong Kong, etc. Anywhere there is a cellular system
using the AMPS, TACS or ETACS standards; including those international systems
that use variable control channel starting points for different countries.

In simple terms, the CSI reads the control channel data in a cell and switches
your radio to the specified voice channel when a cellular call is placed or
received in that cell. This allows you to monitor the call for voice quality,
etc. When the call switches to a new voice channel, your radio now switches as
well. In essence, the CSI turns your radio into an extension of the phone that
you're monitoring. No more partial calls. You get it all.

The CSI is a high tech, low-cost test instrument for the service shop, a
surveillance unit for law enforcement, and a development tool for new cellular
and other radio data applications for the engineer or hobbyist.

SAMPLE SCREEN DISPLAY

CONTROL VOICE

```
ZDDDDDDDDDDDDDDDDDDDDDDDDDDDD? ZDDDDDDDDDDDDDDDDDDDDDDDDDDD?
3 NAC=15 3 3 Ring Phone 3
3 555-4540 (312) Registration3 3 Stop Ringing 3
3 555-4540 (312) GoTo 869.8803 3 Disconnect 3
3 555-4540 (312) GoTo 869.8803 3 3
3 555-3238 (312) Paging 3 3 Ring Phone 3
3 555-0186 (312) Paging 3 3 Change Power to .25 W 3
3 555-8252 (312) Paging 3 3 Change Power to 1.6 W 3
3 555-0186 (312) GoTo 891.0903 3 GoTo 890.220 3
3 555-0186 (312) GoTo 891.0903 3 3
3 3 3 3
@DDDDDDDDDDDDDDDDDDDDDDDDDDDY @DDDDDDDDDDDDDDDDDDDDDDDDDDY
```

The sample display on the left shows a control data channel message indicating that the number of access channels in the system is 15. A GoTo command shows a message for 312-555-4540 to switch to voice channel 869.880. This example also shows the system paging three cellular phones. Upon answering a page, the cellular phone, 312-555-0186 in this example, is instructed to GoTo the voice channel on frequency 891.090. This sample display has a number of filter options selected to avoid displaying numerous repetitive commands. Typical interaction on the voice channel, after a GoTo a voice channel, would be like that in the right box.

The sample display on the right, shows system control messages instructing a cellular to ring; then to stop ringing; and to disconnect. Another session follows, showing the cellular answering and engaged in conversation. During this conversation, the system instructs the phone to change power level twice. Eventually the voice channel is changed to 890.220 as the mobile moves into another cell. This display also has some filtering options selected to reduce the volume and type of commands displayed.

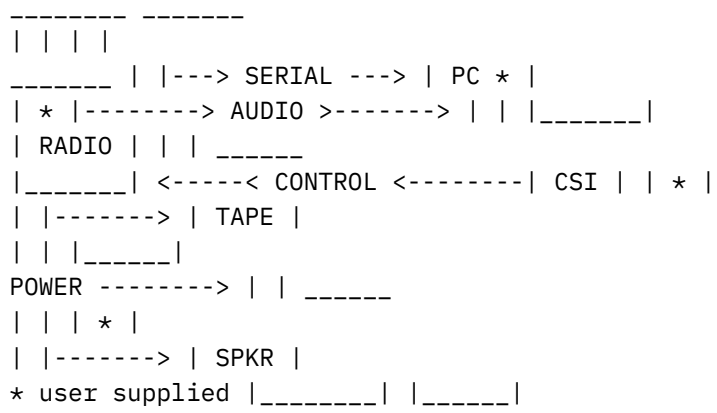
CSI SPECIFICATIONS

The CSI requires audio input from a radio's 455 KHz IF or clean demodulated audio containing the digital data from the cellular control channel. The CSI serial output will connect to any standard 9 pin PC serial port. The output from the CSI is plain text, which is displayed on the PC screen.

The Icom R7000, R7100 and R9000; the AR-2500 and AR-3000A; and the Radio Shack PRO-200x (with the modifications noted later on in this document), can be connected directly to the CSI. The CSI will automatically change the radio frequency in order to follow the call from one voice frequency to another.

The CSI hardware will support future software enhancements such as pager decoding, and trunked radio and MDT surveillance. Preliminary development has commenced, but no firm in-service date is available. When you order your CSI, you'll be on the mailing list for future software enhancements.

The CSI requires 12 volts DC at 300 ma. It is portable for service and surveillance use with a laptop PC.



SOFTWARE

The CSI comes with PC software that can be used to perform advanced tasks. For example, it can be used to wait for specific commands or phone numbers, and take an action only on those commands. It can be configured to keep a log of specific events. A radio that can be controlled over a serial link (Icom, AR, highly modified PRO -200x) may be connected to the CSI and the software will issue frequency change commands to the radio. This will enable you to monitor the audio for voice quality. The following is a list of key software features:

Supports AMPS, TACS, ETACS and international cellular systems.
Two column display to maximize the data displayed.
Separate selection of commands and numbers to display and log.
Select criteria for following frequency changes.
Scans channels based on user criteria (act on specific numbers, etc.).
Automatically tunes and analyses data quality on each control channel.
Auto select active and best control channels.
Display and log DTMF (touchtone) from voice channels.
Presents detailed information on cellular system parameters.
RECC display data includes dialled number and manufacturer's name.
ESN decode and display available to authorized purchasers.
Separate software control of the speaker and tape recorder features.
A general purpose scanning module is included for non-cellular use.
Complete with built-in help menu that you can customize.

RADIO INTERFACE INFORMATION

If you are using an outdoor or attic antenna, use high quality co-axial cable. Common co-ax attenuates 800/900 MHz signals. Belden 9913 is recommended. It has 4 db loss per 100 feet, compared to 20+ db loss for standard RG-58. A small antenna at your radio may perform better than poor co-ax running to a high antenna.

High error rates may be caused by an improperly aligned radio. The recommended radio modifications will make the CSI less sensitive to a radio or cell site that is off frequency. Alignment problems are more noticeable with weak signals when you are on the fringe of a cell site.

An additional software program is included to allow you to tune your radio for maximum data capture efficiency. Once you determine the required frequency offset for your radio, you can enter it in the operating program to automatically adjust all frequency changes to match your radio.

CSI performance is greatly enhanced by an internal connection to your radio. Connection kits, instructions, and schematics, are included with the CSI at no additional charge, when you specify your radio. Soldering is required. Little electronic knowledge is necessary. It's simple. The only exception is the mod to allow the CSI to tune the PRO radios. If you prefer, any radio or electronics shop can perform these modifications for you.

R-7000 / R-7100 / R-9000

Solder a cable with a resistor from a clean audio point to the factory spare jack on the rear of your radio. Replace the existing NFM bandpass filter with a new 20KHz filter. This is a 40 minute job. A parts kit, instructions, and schematics are included with the CSI when you specify an Icom radio.

AR-2500 / AR-3000A

Solder a cable with a resistor from the 455 KHz IF to a new jack mounted on the rear of your radio. This is also a 40 minute job. A parts kit, instructions, and schematics are included with the CSI when you specify an AR-2500 or AR-3000A radio.

PRO-2004 / PRO-2005 / PRO-2006

Solder a cable with a resistor from the 455 KHz IF to a new jack mounted on the rear of your radio. This 30 minute mod allows your radio and PC to interact with the CSI, and read and display the control channel data.

Make a small IC assembly to mount in your radio. Connect 7 wires to a new connector, 8 wires to an existing cable, and 3 wires to other points. This more complex task takes 2.5 to 3 hours, and allows the CSI to control your radio, and tune it to follow cellular calls. It provides the highest scan rate of all radios. This modification is FOR EXPERIENCED KIT BUILDERS ONLY. Mods do not affect your radio's normal operation when the CSI is not in use.

The data read-only parts kit, the computer interface parts kit, instructions and schematics are included with the CSI when you specify a PRO-200x radio.

PRODUCT REVIEWS

We gratefully acknowledge the following published reviews of our previous CSI model:

ORDERING INFORMATION

The CSI commercial test equipment set is assembled, tested, and installed in a case. It is shipped complete with a 12 volt AC adaptor, all cables to connect your radio and IBM compatible PC to the CSI, the latest version of our PC software package, your choice of radio interface kit, and an excellent user's guide. To make your purchase an even more pleasant experience, we pay the shipping on pre-paid orders.

PLEASE NOTE: All overseas orders (Europe, Asia, Africa, etc.) must be pre-paid in US funds. An overseas shipping charge applies. Overseas orders do not include the AC adaptor. You'll need to purchase a 12 volt AC adaptor locally to match your country's electrical supply. We'll ship your assembled and tested CSI unit from the United States. To avoid any last minute surprises, please check for any duties or taxes that your country levies on imports. Most countries classify this equipment as a radio and/or computer interface for duty purposes. We're confident that you'll be pleased with your unit, in spite of the modest additional cost.

ESN decode and display capability is available for service shops. There is no additional charge. Please provide an original letter from your network provider on their letterhead. It should endorse your use of this capability, and must be signed by a management official. ESN capability is also available to government and law enforcement without the letter requirement. Ask for it if you need it. We provide separate surveillance consulting services to law enforcement. Please enquire.

Please allow six to eight business days, from receipt of your order, until delivery. This will allow us time to assemble, thoroughly test, and ship your unit. We use UPS ground. If you prefer another method, please advise.

RETURN POLICY

The CSI may be returned within 14 days for a refund, minus our costs of handling and shipping the unit to you, and US$25, or less, if the parts kit is opened.

5727. RADIO DIRECTIONAL FINDER

Newsgroup: rec.radio.scanner
Date: 1994-06-28 18:34:55 UTC
From: powell@unislc.slc.unisys.com
Message-ID: <1994Jun28.183455.8795@unislc.slc.unisys.com>
Source record: 272385

I have received a lot of mail requesting information,
and/or a schematic of the directional finder that I
use. Instead of individually responding, I scanned
the schematic and posted it to the net.

The following describes the directional finder that I
use in tracking transmitters on the CB. It can be
modified to work on any frequency by using the
appropriate antennas, delay line, and spacing between
the antennas. It was originally made to work with the
two meter band, and I converted it to work on the CB.

I did not create it, but was given permission to give
out schematics.

The schematic is in four parts. The parts are called:
"FINDER PART 1", "FINDER PART 2", "FINDER PART 3"
and "FINDER PART 4". The parts have been made using
uuencode, and when the uudecode has been done, the
results will be a "PCX" file.

DIRECTIONAL FINDER USED FOR TRACKING TRANSMITTERS.

To begin with, the LM723 is used to develope a VCC
of 9 volts to operate the electronics. The point between
the two resistors (15K and 10K) is used to provide a bias
point for the NE565 and the MC1458.
In operation, the NE555 provides a reference to the
NE565, and also a switch signal to the directional antennas.
The switch signal will cause the antennas to be directional
in one direction, and then reverse direction on the next
half cycle. The received signal is fed from the antennas
thru the 820 pf capacitor to the antenna input of radio
receiver. Thru one modification of the receiver, the "S"
meter is fed back into the directional to the input of the
MC1458. The output of the MC1458 goes to the NE565 which
compares this signal with the reference from the NE555. The
NE565 will provide a signal which will indicate which direction
the signal from the antennas was strongest.
The meter is a 50 ua center zero and the 100 uf capacitor
is used to dampen the meter. The 10K pot is used to zero the
meter with no signal in. The purpose of the LED's is to show
tge corresponding meter direction in the dark.

SWITCHED ANTENNA ARRAY.

The most important thing to remember is that the two antennas, indicated as antenna 1 and antenna 2, must be identical! Preferably they are to be made by the same manufactorer, and should be 109 inches long, if possible. Under no circumstances should the trucker type antennas be used as these antennas do not have the correct impedance, and in order for the system to work at its best, the antennas should be resonant. The length of coaxial cable indicated by "X" in the diagram is dependant upon individual choice, but the lengths must be the same both antennas. The input at the left hand side of the antennas in the dotted lines comes from the directional finder output. Use coaxial cable to hook up the antennas, the delay line, and the input to this part of the finder. If possible, put everything except the antennas into one box for ease of handling.

A DES-encoding cordless unit should be interesting enough! Frequency agility wouldn't really be required ... unless your scanner's got enough computational capability to break the DES encryption ;-)

>Bill

You need a few things to do this:

1. you need a radio receiver which can receive the voice channel,
but does not have the high frequency components of the audio attenuated.
The "BZZZT" just before handoff has the information you want to know, and
it is a 10,000 bit per second data stream (manchester encoded) so the
audio freqency of this bit stream is between 5000 Hz, and 10000 Hz. Most
receivers will attenuate this frequencies since most radios are optimized
for the 'normal' audio below 3000 Hz. Sometimes you can find a point on
the radio before the lowpass filter'ed audio, and sometimes you can't, so
you have to build your own 455Khz IF decoder (on virtually all radios,
there exists a signal with a 455Khz carrier frequency, and the audio is
modulated on top of that - and this audio has not yet been filtered)
using an IF discriminator chip. After step 1., you have the audio.

2. Now you need a way to read the audio. Since it is 10000 baud per
second, you will need to read it at least at 20 K samples/second
(Nyquist) and since it is manchester encoded, it is much easier to do it
at 40000 samples per second (since the clock is implicit in the encoding
as well.) The easies way to do this is with a DSP evaluation board, but
it can also be done with a soundblaster that can support 40K samples per
second. (8 bits is more than enough resolution.) In either case a
development environment will be required to program the hardware. What
you are looking for is slope at the middle of each bit time. A '1' bit
means that during the middle of the baud time (and a baud time is 0.1
milliseconds, or 4 samples at 40K samples/sec.) the signal is rising
(becoming larger is voltage), and a '0' bit is signified by a downward
slope in the middle of the baud time. On completion of step 2, you
should be able to differentiate and decode the '1's and '0's of the
packet stream coming from the cell site.

3. You need the specification of the Frame formats and the frame bit fields, EIA 553. This allows you to determine content of the frames and which channel the phone has been instructed to go to (excuse the dangling participle.) Derivation of the channel number allows you to use the algorithms implied by the spec to determine the new destination frequency. Upon completing step 3, you know what the new frequency should be.

4. For whatever reason (court ordered survellience, etc.) you may wish to continue monitoring the conversation on the new voice channel without the latency of manually typing in the new frequency (by the time you get there, they may have hopped someplace else, terminated the call, said the location of the drug deal, etc., and you missed it.) This means you will need a computer controlled frequency synthesized radio which you can get a development environment to program, so that you can write your own code to control the radio. This limits you somewhat. The Icom interface is published, and the PRO-2006 has aftermarket solutions, and there are other solutions as well. You need to integrate your DSP code with this new computer controlled radio code. When this is completed you should be able to determine and change your radio to the new frequency.

4. Unfortuately, cellular has channel reuse. This means that *even* if you could hear those on the voice call because they are close enough you may not be able to hear them because, after the handoff, someone else may be closer to you on the same frequency, and the 'strongest signal capture effect' of FM radio will tend to block out the one you are interested in, and instead give you this other conversation which you are now listening. You have some options:

1. You can determine through heuristics where the destination cell site is and select a directional antenna pointed at that cell site (e.g. computer controlled antenna turner, multiple yagis with one pointed at each cell site, etc.) by knowing 'interstate 27 travelers often get handed from this cell to that cell and that cell has control of these 40 voice channels, of which the new destination is one of them,etc.'

2. You could revisit your DSP code and determine which SAT tone (see EIA 553) was supposed to be on the new channel and determine that the 'wrong' conversation is now on that channel and therefore you are no longer interested, or

3. You could just monitor the new voice call (which is probably illegal now cuz you don't have a court order for this new voice call) and follow it.

BTW, there are more than one solution on the market today to provide aftermarket add-on functions to radios such as the PRO-2006. The add-ons are less than $500. Commercial products built around the Icom R7x00 are also available but are much more expensive... but this is buying your way around the problem, not solving the problem yourself.

No, it is not common but it can happen if the base determines that the
call may be getting co-channel interference (e.g. from a distant base
station involved in a distant call.)

>(2) I would guess that
>the reason a call changes cells is because the caller is moving. If one is not

>strong lest splatter or unwanted capture occur. Thus, is there any point to
>trying to follow a conversation across cells if one
>is not mobile or using high gain, directional equipment?

It is not uncommon for cell sites to be positioned well, have directional
antennas, and be transmitted at up to 10 watts or more. This means you
can hear them quite a ways away, even with an omnidirectional antenna.
With a good antenna, the limit is usually the reuse of the channel by
another user at a different cell site. When load is low (e.g. few
channels are in use, e.g. at night) this is much less of a problem.
Often times police monitoring activities occur at night as well.
Following hops of 6 or more on a lightly loaded system is common, and 2 or 3
hops average under heavy load is not uncommon.

Not so. Tapping fiber is trivial. Also, Clipper would not in any way
solve this 'problem', since in order to get the Clipper communications to
decrypt, you need to tap the phone (unless one of the parties conveniently
records it for you, or other extenuation circumstances transpire).

I am looking to upgrade from my now defunct Bearcat 70XLT.

I have decided on the Radio Shack PRO-43, and have found that Mary Mack is cheapest at $288. If anyone is interested in selling one of these already modified for cellular with the standard Monitoring Times MOD that is floating around, I'd be interested in the best price.

Please E-MAIL all info to me at Media 2K @ aol.com

Thanks.

> the extra $65 would not be too bad.

I have both the 2026 and the 2006. As you imply they are not in
the same class. The 2006 is a GREAT scanner, but the 2026 is great
also. The 2026 is designed for mobile use, which means it has
greater sensitivity, and it has NO INTERNAL TRANSFORMER. This means
you must run it off a 12V DC battery, or a 12V DC power supply.
If you're not prepared to buy a battery and charger, or a power
supply, you shouldn't get the 2026 :-). I've never used the 2026
with a large permanent antenna since it does just fine with a
collapsible antenna. If you put a bit antenna on it you might
have problems with overload. The 2026 has some disads that you
probably won't care about in terms of how many monitor channels
it has vs the 2006, etc., but that's what you pay extra for. Oh!
If you take the power off the 2026 (i.e. disconnect the battery
or turn off the power supply) you will LOSE ALL STORED FREQs in
the 100 memory channels. This is a bummer, and if you're not
going to install the thing in your car it's a shortcoming you
should think long and hard about.

5734. At a tragedy with a scanner

Newsgroup: rec.radio.scanner
Date: 1994-06-29 00:26:43 UTC
From: mrosneck@wv.mentorg.com
Message-ID: <2uqf43$i17@hpcan240.mentorg.com>
Source record: 272382
Cross-posted to: rec.radio.scanner,rec.autos.sport

I had an experience this weekend that I thought I'd share with the group. Armed with my new SportCat scanner, I went to a local racetrack for the evenings Super Modifieds. It was pretty interesting listening to the flag stand and the corner workers. I also got a kick out of hearing all the mini-crises that had to be dealt with to get the events pulled together.

During the main event, one of the cars flipped over into the wall in front of the stands. The wing was ripped from the car and flew down the track. When the car came upright I saw that the role bars had literally been crushed into the car. The driver was not visible.

After a few moments, it became obvious that this was a serious accident and after listening for a while longer it dawned on me that I was sitting in the midst of a number of the driver's wives and family all wanting badly to know what the situation was.

The next day the news reported that the driver died of massive head injuries.

I'm certainly glad I kept my mouth shut about what I was hearing.

As an aside, I think the track handled the situation pretty well all things considered. They were obviously well aware that fans and crew had scanners so they used the radios less and less as the seriousness of the situation became more clear. In fact, the radio traffic was, for the most part, very measured and professional.

If there's a point here it's that having a scanner in such a situation could easily turn you from a passive observer of events to a participant in a way that actually makes the situation worse. If you take a scanner to an event of this sort, you might want to give some thought about how you would react if a situation such as this occurs.

Regards,

Mark

Is there an FAQ or location that has reviews on the Radio Shack Scanners?

I'm fairly new to this group but I haven't read of any performance comparisons that could help me decide on one scanner (or model) over another.

I can get the PRO 2026 for $135, the 2032 for $200 or a 2006 for $359. I don't really need the extra 100 channels on the 2032 and I like to low profile of the 2026. But, if the 2032 was clearly a better performer then the extra $65 would not be too bad.

The 2006 is a little more than I would like to pay at this time since I would rather purchase a full communications receiver if I was going to pay this much. (No flames - 2006 owners! Just a simple opinion ... from a simple mind.) In fact I understand there is development underway for a computer interface ... something I was thinking of doing eventually with what ever I purchase.

So ... any comments would be appreciated from anyone who knows where I can locate any performance specifications on these units. Or are there significatly better scanners out there that I have just overlooked? Please ... not looking to any ... my scanner is better than my scanner threads starting here! EMail appreciated.

I run my 2026 in the house with a $10 Radio Shack DC converter. Just be sure you've got at least 500mA of current out of the converter. No need to spend big bucks for a full-fledged power supply.

Also, I moved the radio from the house to the car. It was unpowered for about a half hour, and when I got the wiring done in the car and turned the radio back on, it had retained every one of my preprogrammed channels. For $135, I consider the 2026 a fantastic buy. I paid more than that for mine, and mine was used, and I still feel I got a bargain. ---Dan

I've used my scanner on several different airlines all with PIC
permission. For the most part, using them to monitor VHF-AM
communications is a waste of time. Unless you can open the window (g)
using the scanner will not produce much. If you want to monitor police,
fire, the forbidden band, then the scanner will work ok. If you really
want to monitor air to ground communication,in the air, the best
solution is your own aircraft or fly United and hope you have PIC who
will flip the observers audio switch.

Depending on which particular band you will be
scanning, I would reccommend the small $15.00 RS antenna.
Particularly for 150-1300MHz. The cable run sounds a bit long,
but this antenna has performed very well for me. You might
look into ways of shortening that cable length and might
consider avoiding RS cables. Really, any decent quality
antenna is going to do the job as long as the installation is
done right. Good, clean connections, no shorts or crimped
cables, and a well grounded antenna and mast will pull in most
stations in your area.
Try Grove. I have heard good things from this
newsgroup about it. You might as well order everything at once
tosave shipping costs. Good luck.

>points! :-)

I have a Yupi 7100...like it a lot, but use my BC220XLT a lot more. The 7100
is not great for USB reception either as it drifts.
While it has lots of channels, you either scan all 10 banks or just four of
them, can't scan 8 for example.
Again, it is a great receiver and I won't sell mine, but above are some
of the negatives you ought to know going in. Suggest you get yours
from Javiation in UK- Also have u checked out the new AR8000?? See Mon Times
that's Monitoring Times or Pop Comm for more info.

This is a trifle misleading. Tapping fiber isn't exactly trivial, but it's not too hard. What is virtually impossible is tapping it indetectably - you have to cut it (which could raise alarms easily enough) to insert a tap.

But tapping fiber isn't really the way to go. Court orders against providers is.

>Also, Clipper would not in any way
>solve this 'problem', since in order to get the Clipper communications to

Did you miss the US legislation that mandates that communications providers (in particular Telcos) provide a spigot for law enforcement agencies to tie into? I'm not sure what happened to that, but it could probably be resurrected if it died, and they wanted it enough.

The Fed's want a cost effective F/O tap. My company was approached to develop such a system, can be done but not cheap like copper wire tapping.

I have to laugh, the Clipper chip is what's making all the news, like the B-2 bomber did in the 80's, then surprise, along came the F-117 Stealth. What should worry people is what isn't in the news (and probably never will until it's already embedded in comm systems). A true 'Clipper' will allow remote tapping on demand. This is very easily done to all-digital communications systems. If you understand network routers and protocol it's easy to envision how simple it would be to 're-route' a copy of a target comm to where ever you want it to go...

I only know about the Portland race. The last two years an outfit
(I don't remember their name) has had quite a professional booth renting
out Uniden 10-channel and 200-channel scanners and selling frequency
lists. The 10-channel units are already set up and documented to make
it easy for anyone to use. The 200-channel units likewise, and
they'll show you how to program the unit, etc. My recollection is that
a 200-channel scanner with headphones costs about $50 for the race
weekend. I thought it was well worth it last year. Only my expectation
that 3 out of the first 4 cars on the grid would be scrambled kept
me from doing it this year. Since a good scanner costs $200-300, and
I'm not interested in having a scanner otherwise, I think the rental
is a good deal.

I wouldn't sell my 7100 either. I have not noticed the SSB drifting but to
me the biggest flaw is the mandatory two second delay before the unit starts
to scan after a frequency goes silent.

>line of reasoning.

All "harmonizing" aside...

I find little merit in a law that cannot be enforced! It's like making
drugs or guns illegal. Because of the Electronic Communications Privacy
Act, cell phone vendors are happy to tell prospective (or existing) customers
that their cellular phone calls are secure or cannot be easily monitored.

Try this... Call your local vendor, play fat dumb and happy, and see what
they say when you ask if someone will be able to monitor your calls?
Do you think their going to risk losing a sale??

Better yet, wait till they finish their sales pitch and then inform them
that you are with the local news media. You are doing a story on cellular
privacy and the conversation is, in fact, occuring over a cellular phone.
You are also recording the conversation captured by a $200.00
scanner. This is good for a laugh ot two!! :-))

The point is that if it's easy to monitor, a criminal, or anyone else after
any information you may divulge, is not going to care about a law that
is unenforceable. There is no shortage of high-tech white-collar crime.

IMO, Clipper is not the solution. It's just an open wire-tap license for the government. I am, perhaps, MORE worried about uncontrolled government monitoring than anything else.

Rather than making laws, let's conentrate on making data truly secure, from the government and anyone else.

Personally, I never divulge anything too personal (account numbers, passwords, DTMF tones) while using my cell phone. It's about as secure as broadcasting the data over an amateur radio 2-meter band repeater! ;-))

If the Milwaukee area ever gets TDMA (or CDMA) cellular, I may change my attitude. For now, at least, I will not rely on the ridiculous ECPA.

5754. ICOM R-1 Receive Problem

Newsgroup: rec.radio.scanner
Date: 1994-06-29 15:13:58 UTC
From: DEVENNEY@VM.TEMPLE.EDU
Message-ID: <16FE49DF6S86.DEVENNEY@VM.TEMPLE.EDU>
Source record: 272402

My ICOM R-1 has an intermittent receive problem. Periodically, when I power it up, I only hear garbled (or no) transmissions. It remains that way after numerous power on/off cycles, and then eventually (often days later) returns to its normal self. I wondered if anyone else has had the same problem or has a suggestion.

K> : but at least they dont ring bells when they arrive!
K> : CID should go the way of the deamon dialer.

If you are willing to pay - Large companys with 800 numbers have
the option to have the calling number displayed when their 800
number is called. Not only is the number displayed but the name
of the subscriber is also displayed. When you make *ANY* call
the first central office knows (for billing) your number. That
information can and is transmitted forward to the called (800)
party. Caller ID is when your number is transmitted back to another
local subscriber and that is another service not yet available in
many areas. Forward transmitting of your number has been available
for many years since the advent of electronic switching. At one
time one company with an 800 number was answering their phones and
saying Hello (your name). This supprised/stuned so many customers
they had to quit doing it. Believe me if you use you phone (except
cellular) they KNOW who you are!

Perhaps I can give a little insite about the communications. Most of the racing facilities and organizations have their own radios. SCCA, the organization I belong to have their own communications equipment. When some special events come up, such as NASCAR, INDY CARS, the group of officials that travel with the series will supply the radio equipment. The official company that supplies the radios is "Racing Radios". From my experience, they usually use UHF Motorola P200, 6 channel radios, with a repeater system. They supply the necessary microphones, DC headphones, etc. We turn the equipment in daily for maintenance and battery charging. We use our normal radio equipment as backup and for other details. "Racing Radios" also rents scanners, and sells frequency lists at the track.

If people are really interested, and would like a great track-side view, consider joining The Sports Car Club of America, known as the SCCA. We have non-paid jobs in many specialties. I don't have any phone numbers handy, but the main office is in Denver, CO.

Fiber doesn't have to be cut to be tapped. It is possible to get light out of fiber by bending. High security operations put wiring and fiber in sealed pressurized conduts. The intent is that cutting into the conduit to get at the goodies inside will cause a pressure disturbance which may be detected. I've heard that spooks are working on or have worked out ways to drill into conduct and install dams and bypassess in a way that can not be detected. If the value of your information is great enough, the other side will spend an amount communsurate with the cost savings of not having to duplicate the your effort of creating the information. If your information is unique, the other side might be willing to spend a lot.

On thing is that it is often easier to get human beings to spill the beans than to go to extraordinary lengths to tap or decode transmissions. For example, consider the magnitude of US intelligence data that the Walker family gave away to the soviets for paltry monitary consideration. Also, consider how long it took the US government to realize it had a problem.

You two are talking two different things here. The original post was about
weather satellites. The response gave the frequencies for the (ground based)
NOAA weather stations.

I don't know of any satellites in the 135-145 Mhz range. The range 135-143.99?
is allocated for aircraft and 144-145 Mhz is the bottom of the amateur
2M band...

: > be learned here. Double darn.

: Are you saying that scanners were available for rent at the race track?
: Can people rent scanners at all Indy Car events everywhere? What kind
: of scanners do you get?

Last year at Mid-Ohio I noticed a booth renting scanners and selling frequency lists. Since I already had a scanner, I bought one of the frequency pamphlets for $15. I'm looking at it now, so I'll copy some information from it.

The organization is called 'Racing Radios-- Fan Scan,' and is listed as being the 'official communications company' for several racing bodies including IndyCar, Nascar, NHRA, IHRA, Arca, IMSA, and several others.

The address is--

PO Box 584
309 Agnew Drive, Suite C
Forest Park, GA 80050
404-366-3796

[I've also heard that they can be reached by calling 1-800-RACE-FAN.]

The radios for rent are primarily BC-200XLT's, but I remember another radio (also BC) as well. I think the prices ranged from about $20 for one day or $35 for the weekend, and included full hearing protector type headphones. The scanners come pre-programmed for the main event of the weekend, and the channel numbers correspond to the car number. For instance, channel number 1 would be Nigel Mansell this year.

The frequency list from last year that I bought was a little expensive at $15, but for about $20 you could subscribe to a year of frequency lists. I'll probably do that this year, as I've since purchased season tickets to Mid-Ohio.

I hope this helps.

Same as laptop computers. During flight, they are ok. But not during
takeoff, initial climb, descent, landing, or taxi.

>That flight was no different than any other.

Just about ALL aircraft (not just commercial) have VOR receivers onboard along with other equipment operating on a wide range of frequencies...

Distance Measuring Equipment (DME) is between 900 and 1000 MHz. TX/RX
Transponders use 1000 to 1100 MHz. TX/RX
Glideslope Receivers are in the lower 300 MHz area. RX
Automatic Direction Finder (ADF) 100 to 1000 or so KHz. RX
VHF Comm 118-136 MHz. TX/RX
VHF Nav 108-118 MHz. RX

You'll find this equipment in your average Cessna, not just a 747. Any of this equipment could be effected by the local oscillator in a scanner. Scanners that scan multiple freq bands can generate higher than expected interference when the LOs switch modes in different bands. I had a rythmic popping on a VHF ham transceiver that I quickly isolated to a synthesized scanner. The pops occured when the scanner went from VHF to UHF and back while scanning channels. Scanning only one band or the other alone caused no trouble. I wouldn't want to experiment with what does and does not cause interference at 600 MPH and 35,000 feet.

Also remember that ALL flights above 18,000 feet are operated under Instrument Flight Rules (IFR). This is the case for just about every jet flight. It is entirely justified for the airline and the crew to be concerned with potential sources of interference. I won't even use a handheld aviation transceiver under IFR unless my primary systems failed.

I'll never forget the interviews with them where they simply didn't
seem to understand that there actually was some reason that they
shouldn't sell military secrets to the Soviets. Some of the
dumbest people I've ever seen - never did figure out why the US
government could have hired such morons in the first place.

no no no. Not weather stations, weather satellites.

I know of one, NOAA-12 on 137.5mhz (or 137.65mhz). I've heard the thing,
it makes an orbit about every 80 minutes. Sounds like a fax, but I've
yet to wait around to catch it.

A better place is on SW 8080.3mhz LSB and 9090.3mhz LSB. The naval
weather station in Norfolk,VA retrasmits GEOS and LEO fax sattelite
pictures every hour, fifteen minutes past the hour. You can pick them
up with a PC, the $5 hamcom interface and a SW radio with SSB.

The faxes are 1000X1500 and truly hi-resolution and awesome.
Check in rec.shortwave for the hamcom faq if interested.

I don't recall ever saying it was. No doubt my (any) post can be edited to make it appear to be that, however. What I did say--and I'll repeat only because there are two people with the same confusion and both snip the relevant material from their followups--was

: If some can't see the
: problems posed by a newsgroup where posters openly speak about committing
: illegal activity in the area/topic to which the group is dedicated, I'm
: afraid there's little I can say to help.

You can go back and reread the post. It refers to admissions of engaging in illegal activity and encouraging others to do likewise.

To repeat once more: if you don't see it I can't help. Really.

Shouting won't change anything. Sorry I can't help.

5774. Re: Weather Satellites?

Weather satellites come in a few varieties actually...there are a number of
them in the 137 Mhz range, most often at 137.5 Mhz. Also in the high
2.x Ghz area I think. Some of the more prevalent ones are:
NOAA-9 137.62
NOAA-10 137.5
Meteor 2-20 137.85
and so on. You'll need a special demodulator to make the signal sensible,
but most any decent antenna will do. Discone is very good as is omni-
directional. Also, the bandwidth of most scanners needs to be modified
to deal well with the signal from these 'birds'. Suggest read MARCH 1994
"73 Amateur radio Today"...has list of vendors and satellite freqs. etc.
Also excellent coverage every month in "Shortwave Magazine", a great
British publication.

Much thanks to the several who pointed out some of the features I was wondering about. I ordered the 2026 ... the memory will hold up to 14 days according to a couple of EMails I received.

For those who have access to a FAX machine (or FAX MODEM) you may be pleased to know that TANDY has a technical FaxBack service. Dial it up and patiently go though the selection process until you get to the product (scanner) you're interested in. By following their instuctions I was able to capture the specs on several scanners (in only three dialups!).

For those interested the number is (800) 323 6586. As usual, no humans there but if you'll be patient you can work your way though the menus and get the info FAXed back right after you hang up.

FWIW the Tandy HUMAN help line, a TOLL number, never got me to a human ... just a continuous steam of messages telling me to "hold on ... your call is important to them, etc. " . So I gave that one up after a 5 minute wait.

Charles ceddlemon@a1.stim.tec.tn.us

Chris Lewis <clewis@ferret.ocunix.on.ca> writes

>This is a trifle misleading. Tapping fiber isn't exactly trivial, but it's
>not too hard. What is virtually impossible is tapping it indetectably - you
>have to cut it (which could raise alarms easily enough) to insert a tap.

Actually, this is a trifle misleading too. It *is* possible to tap a
fiber without cutting it.

If you bend a fiber at a sharp angle, a little light will leak out at
the bend, since the light is now striking the side of the fiber at an
angle greater than the critical reflection angle. Therefore, you could
make a clamp-on photocell with a waffled surface, like this:

```
|_/\/\/\/\/\/\_|
_/\/\/\/\/\/\_
| |
```

You strip the cladding away from the fiber, exposing the bare fiber,
and then clamp it between these two pieces. The fiber makes a series of
sharp turns, and a little light leaks out at each turn. The photocell
picks up the light, and there you go.

Obviously, this is not a simple technique, and it leaves the fiber open
to breakage after the tap is complete.

Microsoft, to prevent any kind of tapping of their fiber, runs them inside
a gas-filled pipe. If the pressure of the gas drops, they know that the
pipe has been breached. (ref: some article on Microsoft I read a couple
of years ago, that was talking about their internal network.)

If the Federal govt mandates all commercial comm's mfr's to incorporate
'Clipper' type technology or face not meeting FCC type acceptance, and thus
not being able to sell their products, what do you think industry will do?
They will GLADLY incorporate it; who's to say it isn't already?

Didn't you ever suspect that Clipper is just a smoke screen? On can not
believe that the government is going to release such proprietary technology
to the public.

You're also proceeding from the assumption that American business practice
is based on truth. If businesses tried to base their sales on truth, they'd
go out of business, fast. I'm not saying outrageous 'lies', just the
policy of 'what the customer doesn't know won't hurt him' attitude. In
effect, mfr's may not even know if they are integrating such technology
into their products. Any fellow ASIC designers/integrators will agree,
you can embed such a system into a chip used in a comm system and the
designer won't even know he's designing in such device. If the data sheet
doesn't mention what's embedded, the designer doesn't know what's in the chip,
it's that simple.

Andy

Yes
137.62
137.50
137.85
137.50
137.30

There is also a really loud satellite on 149.995. I think it comes around
every 90 minutes (at least here in NH) and is some type of navigation
satellite, though. You'll hear "heart beep"-like telemetry. You can hear the
doppler effect as it flys out of range!

I can hear them on the 2006 with the telescopic antenna or the DISCONE
antenna. A good starter article was printed in 73 magazine "Getting Started
With Satellite Imagery by Tom Glembocki". The issue is March 1994.

>
> What I need to know is what kind of antenna I need to pick these up. Any
> pointers or plans would be appreciated.

There are some "plug and play" PC boards/software. The coolest package I've
seen advertised has a self-contained VHF/UHF receiver.
You supply the antenna. Then with the supplied software,(it's a combo satellite tracking
program/signal decoder)
you can get the satellite images on your screen.

Quorum Communications in Tx sells such a board/software for 695$

: It is from the Fermi Lab property in Warrenville/Batavia. Nobody seemed
: to know exactly what it was for, but radiation monitor makes sense.
: Some CARMA members even heard synthesized voices on the system that
: sounded eerie. <g>

The federal bands is loaded with continous tone sensors. Here on the west
coast of Ca. most are seismograph telemetry signals. I remember receiving
a similar telemetry signal, like you've described, at the Savannah River
plant outside Columbus, Ga. It was used to monitor radiation levels at
specific sites on the property. Sometimes they use synthisized voices to
report battery voltage levels, weather info, ect. They're great to hone
your direction finding (triangulation) skills.
The Savannah River plant also used to place small continous tone transmitters
attached by collar to small furry animals which they would track around
their rather large property. Periodically, they would capture the animals
and develop the film in doseometers (also in the collar) to check for
radiation levels around the area...

M> Not so. Tapping fiber is trivial. Also, Clipper would not in any wa

NOT SO - Taping fiber is far from trivial and after you have managed
to tap the fiber (single fiber capacity in excess of 50,000 channels)
just how do you go about demuxing the DTM signal into a single channel?
That technology is not cheap nor small. Ok so you have done the
tapping and have the mux - not search out the ONE signal that you
really want out of the thousands being carried by the one fiber that
you have tapped - and - what about the other 15 fibers in the cable -
perhaps the one signal you wanted was in one of them. GET REAL -
if anyone wants to TAP anyone they still go to the Telco central
office and find the line that they want already demuxed down to
single channel (circuit) levels. There is already a way to double
the capacity of the fiber by using different frequencies of laser
light - soon the capacity of a single optical fiber will be inexcess
of 250,000 single channels. TAP FIBER - Not very likely or smart
when you can go right to the CO.

As a corner worker, we are kept informed of any incidents around the track. At some tracks, we end up with spectators hovering around the turn station because of the good photo opportunities. We generally refrain from telling spectators the full background information that we receive.

It is best to keep in mind that some of the people around you may have more than a passing interest in incidents. I guess that people with scanners should remember this too.

>Why?

[NOTE: this perspective is that of a short time corner worker]

In my short time as a corner worker, I've not had to work a serious
incident. However, everyone's adrelinie goes up when this happens.
Things may get reported that are just conjecture, or may be wrong
(i.e. SS cars that lose magnetic numbers in impacts, I've go a 2
and a 4, but you dont know what order they belong in). Besides that,
The communicator should be stuck to their captian like glue in that
situation anyway, so you may not have time to deal with other things at that
point.

>|It is best to keep in mind that some of the people around you may have more

>|should remember this too.
>
>
>I'm not sure why this is an issue. If my loved one was hurt, I'd want to know
>ASAP what was happening. What am I missing here?
>

For the reasons above. Even if the information is correct, you might cause
unneeded commotion on the corner, making matters worse. Drivers do
unpredictable things after incidents. I can picture the family member or
friend of someone who was in a serious crash doing the same, like running
across the track to get to the area. That's about the last thing you would
need in an already hectic situation.

Any of the more experienced F+C folks out there, feel free to correct me,
I'm still on the learning curve.

|> --
|> Ken Morrill <kmorrill@strauss.udel.edu>

The primary reason is that the phone net, and the scanners, do not always have the most up-to-date information as to conditions. I do keep other corner workers informed via hand signals, but to rely on information given out in the heat of the moment can be dangerous. Remember also, not all corner workers are medically trained, and if the information is not relayed exactly, can cause even more confusion.

I am not saying that I will not say that a driver is OK, but I will not give out any other information as to condition other than unknown. So, if you ask me after an accident at a race track, what the condition of a driver is, I will tell you that he/she is OK (walking, talking, knows where/who he/she is), or I don't know their condition. Even telling a spectator that a driver is OK can be dangerous though.

At a Hospital, or at the scene of an accident with EMT's present, it is best to let the medical people make a determination and a pronouncement as to the condition of the injured party.

[snip]

If it were my loved one, I'd want to know *accurately* what's happening.

Misinformation travels fast. In the first few minutes of an emergency, there's likely to be a certain amount of confusion, maybe even panic. Pieceing together an accurate account from the radio traffic may be difficult, especially when multiple agencies and unfamiliar jargon and codes are in use.

In the case of a single vehicle crash in a controlled environment (i.e. the racetrack), the situation my not be so bad. But in a multiple casualty incident, it's tough to get a picture of who's injured, how badly etc. In major disasters, it takes hours or days to assemble a confirmed casualty list.

The situation in the emergency room, after the patient has been assessed and stabilized, is quite different.

So unless you are 100% sure your scanner can provide accurate information that won't be misinterpreted in a situation of great anxiety, better keep it private.

Just my opinion.

Happy scanning,

Kent

5805. Radio Shack PRO-34

Certainly. Emergency-room physicians are briefing the family,
directly. You are asking for race emergency staffers to brief anyone
who asks, or who listens with a scanner. Most of those asking and
listening have no right to that information, and most of them would
misuse it.

Let's say you're a cornerworker, and you've just responded to an
incident where what you see in the car makes you turn away for a
moment and catch your breath. Spectators are leaning up agains the
fence, yelling for information. What would you do? Having worked
several major incidents involving driver injury at pro racing events,
I am quite certain that informing the masses of spectators as to the
specifics of which bones are broken, and which extremities damaged, is
absolutely the wrong thing to do. Whatever you say undoubtedly gets
built upon and embroidered as it spreads, and you have unwittingly
added that cachet of officiality, since "it came from a cornerworker".
Eventually it gets back to the family as "official word", probably
after the much-filtered offhand comment is picked up by one of the
broadcasters. It always seems to get there before the true official
word, and it inevitably makes their suffering as they wait much worse,
since the spectators have undoubtely sensationalized it. After all,
they have no stake in the matter.

Accurate information on the driver's condition must be delivered to the driver's crew and family. It must come from one, and only one, source. That source is the race medical staff. It should not come from cornerworkers, spectators, or anyone else, since _they don't have the knowledge_ to accurately convey the information. The race medical staff need that time to make an accurate asessment, and then get back to the family and crew. Then, and only then, do the spectators have any right to that information.

The last people you tell anything to at a pro racing event would be the spectators. The more ghoulish among them will immediately begin embroidering the truth, just so their story will make a bigger splash among their friends. If you are a race worker, your policy has to be not to feed that fire. You are, after all, a race official, and even if you're just a kitty-litter sweeper your word among the spectators is The Official Truth.

If that isn't perfectly clear, I can only suggest that you attend a major race and watch the expressions you find on the faces of the spectators who press up against the fence at a major incident site. By and large, these folks aren't the true race fans... I have been on the other side of that fence, many times. I have also grown tired of the bare-chested, beer-swilling "race fans" who stand there and shout "Is he dead? Come on, let us see him!".

Faugh. Those aren't race fans. But they are inevitably the ones who bray the most loudly that they have a "right to know" that was conveyed upon them by the purchase of a ticket.

Sorry if that rubs some folks the wrong way. But IMHO, there is only one right way to disseminate info when a driver is hurt, or worse.

I've outgrown my Uniden Bear Cat 70XLT hand held scanner, so I've
decided to sell it and upgrade to a BC 2500XLT. As a result,
I am selling my trusty old 70XLT for $125 (OBO). This scanner
is great for persons new to scanning! Here's the specs:

20 Channel programmable hand held scanner
- Priority Channel
- 2 second delay for "call backs"
- search function for quick searching through an entire range
- illuminated LCD display
- earphone jack
- 7" flexible antenna
- locking keypad

I'll also throw in the 1993 edition of Police Call (vol. 9) and tons
of frequency listings I've accumulated and have stored in a database.

Price is $125 or best offer. This thing is in great condition and
works perfectly, I've just outgrown it and am now buying a
400 channel scanner. Serious inquires only, please. Reply to:

Time to put my two cents in. Having worked corners, and on-course for over 20 years, and currently on the SCCA Emergency Crew, I have noticed the following:

I recall some fatal accidents were we were consulted by officials and advised not to talk to anybody about what we saw. That is, people not involved with the situation. The main reason is because eventually these usually end up in court. Look what has happened with the OJ story, with wrong information getting out to the public.

There have been situations between drivers concerning their performance, or lack of. Sometimes there are hearings after an event to determine fault, or who the actual winner actually was. Again, legal situations may develop.

We usually use landlines where possible for discussions that are sensitive. There has been some discussion about having scramblers, but I dont think that is necessary. If the info is that sensitive, it can wait.

Hope this helps -

James Holtzman (holtzman@shazam.ecs.csus.edu)

These are LEO (low earth orbit - ~200miles up) and scream around the
planet once every 80 minutes or so. They are low enough to pickup with
your scanner (AM I believe). GOES (geo synchronous orbit) are 25,000
miles up, transmits above 2ghz and require a dish. Some GOES weather
pictures are retransmitted on SW by the Navy (8.08mhz LSB).

Hi, Simon...

-=> Quoting Simon Collings to All <=-

SC> I am quite a fan of these radios. They are readily available here
SC> in the UK and have good back up service via the importer. They have
SC> good performance and even my old AR-3000 (AR-3000A predecessor)
SC> leaves my ICOM R-7100 standing still as far as scan speed is
SC> concerned. Is there something wrong with AOR scanners from other
SC> user's point of view?

I don't have an AOR scanner, but have seen alot of reference to them on CompuServe. From what I have read, there are alot of quality problems with AOR units. Units received defective, deaf in some bands, poor design of the radio, inconsistency from one unit to the next (IOW, one picks up signals and the other won't on a particular freq). After what I have read, I wouldn't chance the purchase of one. And people say word of mouth doesn't damage a products name.

5816. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-07-01 00:00:18 UTC
From: bill@thd.tv.tek.com
Message-ID: <2uvmai$c4j@news.tv.tek.com>
Source record: 272363
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 10-Jun-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are
| available by region or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

| State floppies are $60 per state (add $5 for CA, FL, NY, TX, PA, OH, IL).
| Regional and full US CD-ROMs are $105 each. CD ROMs by category are $155 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various
| products are indicated by "#" or the field length, if known.

>
>WAY TO GO ROGER, WAY TO GO RACEFANS!
>
>Bah

Well it's easy for Roger to back-off now that he's so dominating. If he
was struggling to get an edge on the competition do you think he'd
be so gracious? Knowing Penske, I wouldn't say the war is won forever
against scrambling. He's probably got code-words ready to switch back
on demand if necessary.

We'll see in the long run. I still see Roger as the businessman. At this
moment in time the good PR to let a few eavesdrop outweighs any need to
be private (with his current advantage), so I wouldn't gloat too loudly.
If it were Bernie Ecclestone and not Roger Penske we were talking about,
I'd suspect a "kickback" from the scanner vendors as the motivation :-) :-)

Anyone in the data-comm field knows there's no such thing as non-intrusive
fiber taps. Anyone w/any ELEMENTARY physics background will confirm this.
Come on people, you gotta stop looking for computer supplies in your
J.C. Whitney catalogs...If the catalog states non-intrusive, they're
trying to sell you a line of crap; what? false advertising? naaaahhhh....

5819. For Sale : PRO 2006 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-07-01 02:53:48 UTC
From: bjohnson@fcom.cc.utah.edu
Message-ID: <2v00fs$2cf@fcom.cc.utah.edu>
Source record: 272365
Cross-posted to: rec.radio.scanner,misc.forsale

I am selling a Radio Shack PRO 2006 scanner. It covers the following ranges:

25 - 520 MHz
760 - 823.945 MHz
851 - 1300 MHz

It is only 3 months old, and in perfect condition, and of course I still have the manual for it. It has been modified enabling it to scan the cellular frequencies. For those who may not know, the scanner picks up everything from FM radio, to cordless phones, police, fire, aircraft, weather, Ham, TV, CB, and much more. It has the following features:

Stores 400 channels in 10 banks of 40.
Individual bank lockout.
2-Speed scanning (13 or 26 channels per second).
Priority channel.
AC/DC powered (12 VDC cord not included).

I don't know what more to say, except that an article which was posted on the newsgroup rec.radio.scanner this last Sunday the 26th of June had this to say about the PRO 2006:

"PROBABLY THE BEST SCANNER MADE TO DATE. HIGHLY RECOMMENDED."

The article was titled "Buying a Used Scanner Radio", and was written by parnass@ihlpf.att.com.

I bought the scanner for $425.00 with tax.
I am asking $375.00 OBO. I will also pay for shipping. I unfortunately need the money at this time.

Please feel free to give me a call until 11:00 P.M. My telephone number is 801-254-5160.

Blaine.Johnson@merit.com

Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

< Dated information here >

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat

transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

writes:
>> I am also told that the interface is RS232, so basically any Computer
>> can control your scanner. You just need to write an interface for it.
>
>Do they make the protocol public?
>

yes. i ordered one today and they will be including the
docs for "CI-V", which is what the interface speaks. you
do have to ask for it separately though (no charge).

it sounds like it's fairly easy to deal with, being
something that's fairly readable (ie, it's in ASCII, not
binary).

Anyone out there have any PRO-46 mods or test mode info?
Also, anything on Uniden CP6600 cell fone?

Anyone travelling on the Wisconsin highway noticed that there happends to have many undercover Wisconsin State Patrol, or normal Wisconsin SP hiding between highways and waiting to pull someone over, and indeed I saw many got caught. I think it would be interesting to listen their (State Patrol) fequences if anyone could post them here or email me one.

Thanks.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- when existing stocks are depleted, it will be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you

get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and

ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores | like Wal-Mart, K-Mart, Service Merchandise, and Circuit | City sell scanners, but carry just a few models. Depart- | ment stores, like Sears Roebuck and Montgomery Wards, some- | times offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, * KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a restocking fee for | returned merchandise. Telephone (713)392-0747. |

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be | sure to include these when comparison shopping. |

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET

INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint | experienced scanner hobbyists and is better suited for | beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a | private company, to sell FCC license information to the | public on both floppy disks and CDROMs. You can buy the | full license information for a multi state region or a less | detailed license database covering the the entire USA on | CDROM for about $100. |

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of | 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

August 13 *
October 15
December 10

Bring a notebook and your appetite.

It could be (#1) the check for traffic on the priority channel or (#2)
a switch between bands. I scan all FM stuff exect for the civil & military
aircraft emerg freqs. Each time my 2006 hits these it gives a pulse noise
(almost a click) through the tape out thats not heard on the internal (or
external speaker). Since it happens at the same spot each scan pass based
on the number of channels active it can appear at almost any time value.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S *

[NOTE: This article may not be reproduced in whole or in | part on CDROMS, in bulletin boards, networks, or | publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition | is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a | private company, to sell FCC license information to the | public on both floppy disks and CDROMs. You can buy the | full license information for a multi state region or a less | detailed license database covering the the entire USA on | CDROM for about $100. |

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio | operator, and belonged to amateur radio clubs, but I never | realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of

listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article. |

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio | room" wall, to compile frequency lists, then monitor | the listed frequencies to confirm that they are | really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation. *

Most listeners use a combination of both approaches. |

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained

radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information. |

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's

"search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work. |

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot | easier for me, and legal for them! (one may use FCC license | microfiche, described in Part I of this article, to | identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the |
actual licensee name.)
Lisle, Illinois *

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls. |

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information. |

The familys going to Delaware in late July and I hate to go without a scanner for a week. So if anyone has frequencies for the Masseys Landing area (including, Dewy and the state parks) please post or e-mail them.

We will also be going into MD (have to visit Ocean City). So any freqs to monitor while there will also be appreciated.

Thanks in advance.

> Larry
>

It's not that easy: the easy way to get a signal out of a fiber is to bend it until the light comes out (the angle of the bend being greater than Brewster's angle). This tends to let *all* the light out (unless you bend it *just* right), in which case you no longer have a signal. Moreover, the amount of signal needed to register on a typical photo-diode and be read off by your tap is *not* small: I suspect you'd wind up attenuating the hell out of it, even if your tap only took enough power off the line to read the data.

Now, if you put some sort of *repeater* on the line, it becomes easier. But you'd have to cut the line to do that. Other means are certainly possible, but seem at first glance to be harder than you think. It would be much easier to tap the electronics that drive the fiber-optic: there are drivers that would ignore a modest additional load.

If it helps, the AOR-3000 (and the 3000a) is the finest scanner I have
ever owned in 20 years of scanning.

WATKINS-JOHNSON HF-1000

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.

Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm beginning to think that anything larger is too

cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING

*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost! (these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad

frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was

pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to

sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio

a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65 17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still don't know why Radio Shack discontinued it. If you're looking for a good starter shortwave radio and can still find one laying about at a Radio Shack store priced to move, GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee and I did not know if I would like the hobby or the radio. Good points: direct-entry tuning, 36 station memories, fairly small so it is easy to travel with, speaker sound was good, reception was okay, but improved dramatically with the addition of the Radio Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning steps, only major broadcast bands tunable (large gaps between bands), selectivity not so good, no fine tuning, no BFO, no SSB or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company. The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.

Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All

in all, this radio gave me the best price/features/size ratio
of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I
purchased this little radio. Sure, it's not top shelf, but it's
suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour
clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

YORX AM908 - 1

****
Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for the R-70 and later R-71; they also offer a version for the NRD525. I have the R71 version. It is a synchronous detector which allows selection of USB or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the R71 local oscillators (I forget which one, probably the BFO) to the AM carrier. It contains its own product detector. The lock range is not very large, perhaps +/- 20 Hz. The detector seems to have lower distortion than the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S iaN amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may

be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can
swing the 450's sister model the TS690,you can recieve all the way to 60 mhz.
When the 5000 is put out to pasture,if it's replacement is the 450 without the
transmitter,it will be very tough competition for the other makes.All it needs
is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog
fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch
but it really doesnt matter much.Of all the recievers I have owned,or ad over
here to play with,it is the most sensitive in the SSB modeI have the
standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great
for RTTY or CW(if you are truly desparate!)The "protection"diodes have been
removed due to intermod from a local AM station.The reciever's case,front and
back panels are made of Aluminum,no plastic to crack on the 515!The audio in
AM is very bad,almost as bad as the Icom R-71a,but in a different way.The
audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack
but still a little "fuzzy".In the SSB modes,the audio is pretty clear and
doesn't fatigue me like the Icom dos far as thergonomics goes,it's
almost prefect!All the knobs are the right size,the tuning knob is large and

has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big
and easily seen across the room.Dynamic range is very good after the diodes
have been clipped(a one minute operation).The filters all are good quality
and have good shape factors.This was the first "affordable"rig that had a
memory option that was worth something with 24 or 96 channels available.
The NDH-518 I have(96 ch.)is also made totally out of cast and sheet
aluminum and matches the 515's styling.It stores frequency only,unfortunatly,
due to the year it was designeIm guessing.There are lots of these recievers
floating around on the used market for about $600 or so.Universal seems to have
a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

Japan Radio Company NRD-535D - 1

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely

sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the

"analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable

in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF

receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In the AR3000a it has been replaced with a (I guess optically encoded) smooth one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories
.
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of

the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on
the cpu board.

I have a Regency TS-2 scanner. I've had it for about 4 years.
It failed on me once, but otherwise, it is a good scanner.
It is multibanded including 900Mhz. My question is that I
have been following this newsgroup for some time now but I
never read one word about the TS-2. Why is this? Does any-
one have any opinions on this particular model?

Ken K.

5837. MODS WANTED for REGENCY Z60 scanner?

Newsgroup: rec.radio.scanner
Date: 1994-07-01 17:38:37 UTC
From: bunker@wcsn.csms.com
Message-ID: <905@wcsn.csms.com>
Source record: 272237

Does anyone know of or know where there is any mods for this old scanner?
Any pointers or tips would be appreciated.

Please reply direct to bunker@wcsn.csms.com as I sometimes miss the
newsgroups for extended periods. Thanks in advance.

Bunker

"Frequency hopping" and "direct sequence" are both considered spread spectrum technologies. It sounds like the Uniden uses D.S. D.S. is a digital process where the digitized signal is transmitted with additional psuedorandom coding that of course increases the bandwidth of the signal (spreading). Since the receiving station has to use the proper algorythm to sync with the code it has a secure nature.

>Does anyone know what Delta's policy regarding scanner use on flights
>is?

I fly Delta frequently but have never bothered to try using any type of radio on board. Their "Sky" magazine (available onaboard and you can keep it) has a list of prohibited and allowed electronic equipment. While I don't remember everything, they do not allow transmitters, and I believe most receivers and CD players are also prohibited. They do allow laptop computers after reaching cruising altitude (FCC part 15 approved equipment) but do not allow peripherals that attach to a laptop by cable such as a mouse or a printer. This is reasonable... keyboard and mouse cables are a notorious source of RF garbage.

Then again...I see people violate the policies on every flight and the crew tends to not say anything. I gues they don't want to appear mean.

I must say that, as a pilot, I would have no desire for people to be using transmitters or non FCC type accepted equipment on an IFR flight. I am not really sure what scanner users expect to hear with a rubber antenna while riding in an aluminum tube.

Call Delta and ask for a copy of Sky via mail - or just ask them what the policies are. For that manner, the same would apply to United, American, Southwest......etc. Just call.

Take care.

<sigh>

When an Emergency Physician (or other health care provider for that matter) informs a family member of the patient's condition, it is only when A) they are fairly certain of what is going on (not the prognosis, but at least what has happened and what the known injuries are) and B) the family member is in a position to be cared for should they not take the news well.

I think that most thinking people will see the obvious differences between an Emergency Physician giving news to family in a hospital and a scannergeek turning up the volume on his "sportcat" just as the EMTs tell the incident commander that the patient's not viable due to massive head trauma.

Yes -- we have a right to listen to anything we choose to on the public airwaves, including the portion of the spectrum "sold" to the Cellular Telephone Industry Association, but we also have the responsibility to KNOW WHEN NOT TO REPEAT WHAT WE HEAR.

Another reason to limit information transmitted is somewhat psychological. I work communications for SCCA Pro Rallys, and the only "physical condition" information transmitted is either "OK" or "Medical attention needed."

The theory is that the comm workers are not qualified to decide if someone is dead (fine by me), and transmitting this data might make the medical team slower in its response.

There is also the factor of people listening in on the comm freqencies rushing to the scene of the action. I know that no one reading this would, but the "OJ parade" amply demonstrates the number of loonies that might!

I have a Bearcat 800XLT Scanner I would like to sell.
It is capable of receiving Cellular Frequencies.
- 40 channel
- weather

Best offer I get.
I will collect offers for a while and then send everyone a response after
a little while.

Please E-Mail me Direct.
Thanks,
Al

From: media2k@aol.com
Message-ID: <2v263q$icm@search01.news.aol.com>
Source record: 272293

I have heard that it is possible to receive cellular frequencies (or any frequencies, for that matter) on non-cellular channels by entering in an "image" frequency.

If this is really possible, can someone post some details about this? I am about to purchase a 2500XLT and do not want to modify it if it is not necessary.

Thanks.

I'm curious to know where I could find television station frequencies on the scanner. Does anyone know?

I assume that since TVs can pick up stations from an antenna, you could pick up the audio the same way.

5850. Antenna for VHF-LOW

Newsgroup: rec.radio.scanner
Date: 1994-07-02 00:23:56 UTC
From: jdross@sdcc13.ucsd.edu
Message-ID: <69921@sdcc12.ucsd.edu>
Source record: 272302

A few weeks ago, there were some directions posted here on
how to build a simple antenna for VHF-LOW reception. I'll summarize
them here and then ask my question. I took 24 feet of 18 gauge wire
with RCA plugs on each end. I attatched an RCA to BNC connector on
one end, and chopped off the other connector and separated 5 feet of
wire, giving me 10 feet when stretched from end to end. I stapeled
the 10 feet of separated wire on the side of my house, and ran the
remaining 19 feet in the window to the Pro-2030 on my desk.
Now, the question. Should I have taken off any or all of
the insulation on the 10 feet of wire that I stapeled vertically to
the side of the house? My reception has not gotten all that much
better and I'm wondering if that is my problem. Could it be
something else? Would it be better if I put the thing on the roof?
Any hints or suggestions are welcome! Thanks in advance!

5851. VXO Scrambling

Newsgroup: rec.radio.scanner
Date: 1994-07-02 00:57:42 UTC
From: Anonymous User <nobody@soda.berkeley.edu>
Message-ID: <2v2e26$p6d@agate.berkeley.edu>
Source record: 272296
Cross-posted to: alt.2600,alt.radio.scanner,rec.radio.scanner

Hey all..

Ok..here's the deal. There is a type of voice-encryption (scrambling) that is very common around my area. It is not really that secure. It is analog, an older type called 'VXO' scrambling I think. Anyway, as I understand it; to unscramble/scramble, all one has to do is 'tune' the VXO. It sounds kinda like SSB (single side band) on FM. It is not quite the same as simply tuning the frequency off a bit. I can tune my radio in 1kHz steps, that does not work. I know one person who has a 'VXO tuner', and it does work. My question is, *just what is VXO?* The 'tuner' he has seems like a fairly simple device. (4 IC's, 2 relays, several resistors and capacitors, 3 transistors, no surface mounted stuff) He does'nt have a schematic, and he won't let me take a *good* look at it. (I can't see the underside of the circuit board) So anyone got one of these things? (or schematic?) I have seen these (I think) in the backs of magazines like Popular Communications; but I wanted to try the net first. It probably wouldn't be too difficult to run the analog into a soundblaster; and just adjust the VXO. (It is strictly analog, so you can record the scrambled speech, and play it through the VXO tuner to unscramble) BTW, I have heard that Radio Shack sells a phone that uses the same type of analog scrambling/descrambling.

It sounds like they are using simple frequency-inversion on FM. This sounds similar to listening to the wrong sideband on SSB, but since it's FM, you can't fix it by detuning or switching sidebands.

If you can tolerate a bit of a whine, The algorithm to invert the spectrum on your SoundBlaster would be easy enough:

Simply invert the sign of every other sample.

Since the SB (and similar cards) uses unsigned samples, the sign inversion is done as a bit inversion; looks like this:

```
unsigned char samp;
samp = ~samp;
```

This will flip the frequency spectrum about the Nyquist frequency (1/2 sample rate), which is often all those phones do for scrambling. The descrambling is identical to scrambling, if it's a straight inversion. (It's a fun effect to play with too! Try to figure out what to say to make "correct" words come out.. very warped.)

The bummer is that the SoundBlaster can't record and play back at the same time, so you can't do any scrambling/descrambling in real time.

You will have to record the audio to a file and then process and play
it. Probably the biggest flaw in that simple soundcard. Ah well..

Happy Hacking!

I've been working with telecom fiber cables for a decade, and haven't seen one yet that looked like it could be tapped without first applying at least an axe, and maybe a hacksaw. I'd sure like to see this $30 non-intrusive tap that an idiot can apply!

They are sensitive to overload. I keep a 50 ohm BNC scope type terminator
to help in some situations. (It does look like a ethernet port with no
antenna...)

5856. Frequencies in Germany?

Newsgroup: rec.radio.scanner
Date: 1994-07-02 06:42:25 UTC
From: griffith@sfs.nphil.uni-tuebingen.de
Message-ID: <GRIFFITH.94Jul2084225@filippo.sfs.nphil.uni-tuebingen.de>
Source record: 272300

Does anybody have an information on frequencies in Germany,
particularly in the Tuebingen area?

I have the Wolf Siebel book called "UKW Sprechfunk-Handbuch" and
although it is helpful it is too general. I would like to know
frequencies of local transportation, utilities, anything. The Siebel
book only has national allocations.

I've been able to collect some information on my own and would love to
hear from anyone who knows anything about Tuebingen or Germany in
general.

5859. Re: R.S. Performance Specs?

Newsgroup: rec.radio.scanner
Date: 1994-07-02 12:27:44 UTC
From: coyote@clt.fx.net
Message-ID: <2v3mg0$380@clt.fx.net>
Source record: 272305

```
: If you take the power off the 2026 (i.e. disconnect the battery
: or turn off the power supply) you will LOSE ALL STORED FREQs in
: the 100 memory channels. This is a bummer, and if you're not
: going to install the thing in your car it's a shortcoming you
: should think long and hard about.

The current 2026 has a memory backup that keeps channel frequencies
stored for up to 14 days if a power failure occurs.
```

5860. Re: VHF-LOW antenna

Newsgroup: rec.radio.scanner

Your wire antenna probably doesn't work well because you stapled
it directly to your house. It should be as far from surrounding
objects as possible.

My best performing receiving antenna for the 42 MHz range is a ham
radio antenna -- a ground mounted HyGain brand vertical antenna,
cut for 1/4 wave on the 20 meter ham band. (It's slightly taller
than 5 meters in height.) I have a copper clad steel ground
rod driven deep in the ground at the base, and feed the antenna
with a military spec coax similar to RG-8/U.

Notice that 42 MHz is three times the 14 MHz for which the
antenna was designed.

: Also, anything on Uniden CP6600 cell fone?

Try 2,9,L/O while turning on your scanner. It will WIPE all yours freqs
and place test freqs in the first 30 channels. Channel 23 is in the cell
range, you can then scan up and down from there and save channels with
the monitor key.

I have a question about something I heard on the cell band. While in LA I was sitting in my Hotel and I heard a guy and girl talking about getting their phones fixed to get free service for a month my question Is It illegal to hear someone that was using a fix phone to get free service I mean cause their not paying so why should they think what their saying should be private. They were both on cell phone. They also said on the phone were they go to get their phone fixed.

>an idiot can do... I don't think so.

Non-intrusive taps have been demonstrated, although it hasn't been
demonstrated that such a tap is undetectable at the receiving end.
The process involves stripping the cladding from the central core,
wrapping a bare core end around, and sealing the joint with the
right stuff which reestablishes the cladding.

Not your $30 tap, indeed!

I just bought a RS Pro-43, and I noticed that the FCC ID is AA020-300A
which differs from the old ID # which didn't have the A at the end.
Does this mean that this Pro43 can't be modified for cellular?

Please reply ASAP because if I can't modify it, I want to return it.

Thanks!

AT every major race that I have ever worked in emergency services
or crash rescue we have a very detailed disaster plan. Which includes code
words to describe a drivers physical condition. Most of our personnel
know not to give out information over the airwaves. After every major incident
there will be a throng of people gathered around gawking. These are the
same people that purchase the Crash and Burn videos on TNN.
Racing aside we get the same thing out on the streets. A major
accident will occur and people start to come out of the woodwork. AT least
at a race we have a fence to keep the general public away. (All us true
die-hard race fans are already on the other side of the fence!) In the public
one of the most difficult problems we have when the helicopter lands is
crowd control.

In a previous article, jyee@unixg.ubc.ca (Jeffrey Yee) says:

>Has anyone heard of this scanner model from Radio Shack? I bought it three
> years ago. Can it pick up the Cellular frequencies? I tried to find the
>modification text files but most of them were for the PRO-34 and the
>descriptions were different. Does anyone know of any FTP sites that have
>these modification text files?

I also got my PRO-34 about three or four years ago and it has been quite
serviceable, even if the audio is a little on the weak side.

I can tune cell phone frequencies by using the scan ranges shown on the back
plate. Try programming in the 806-804, 851-869 and 896-960 ranges. I have
heard cell calls in these ranges and I think it works because the
cell-phone freqs. minus the receiver I.F. puts them in these ranges. No
mod needed.

Good luck.

>Whats the diff between the Pro-34 and the Pro-35 ?

Dunno.

Isn't that why the Congress has been hashing out a law requiring the
phone companies to provide a "tapping patch" for the FBI to initiate
a tap w/o actually visiting the CO???

And who says that InterNet routers won't be next?

Jeff I agree. Radio shack tends to employ folks little more then the
street people that salvage the dumpsters behind the grocery stores. I
never trust anything they have to say of a technical nature and seldom
trust them to even know what radio shack currently sells.

As they say others mileage may differ but I bet not by much!

This is the stuff on the label on the back of my Pro43:

Model No: 20-300
FCC ID: AA020-300A
S. No. A003974

I purchased it from a Radio Shack in San Francisco on July 2nd.
Can I modify it? BTW - this is my first scanner, and so far I love it!
But I really want to be able to pick up cellular. Not that i would
listen to cellular, I just want uh.... "continuous coverage." 8-)

If you return it, be sure and tell them the reason is because it
can not be modified for cellular. We want them to know we will
not buy unmodifiable -or- difficult to modify scanners. I think
Grove and Marymac still have them available. If not, I am SURE
the Canadian companies still have them...

Actually, we don't have a right to repeat what we hear.

The Communications Act of 1934 makes it illegal for a third party to disclose the contents of intercepted communications without the permission of the participating parties, or to use intercepted communications for personal gain. Ever wonder why TV and radio stations don't rebroadcast intercepted communications, even though every newsroom in the country is filled with scanners and could easily record them? Because it's a violation of the Communications Act of 1934. If they go to the police department/air traffic control tower/fire department and get the tapes from them, it's okay because then they have permission. Think about that next time you decide to sell that tape you made to the local media, demanding on-air credit for your work. It might result in a complementary visit from some suits with Federal ID cards....

And then of course, there's the whole issue of the ECPA, which makes it illegal even to listen to certain communications.....

From: daren@morgan.ucs.mun.ca
Message-ID: <daren.9.00100972@morgan.ucs.mun.ca>
Source record: 272150

Here is question that have been trying to get answered for some time.
What scramble techniques are available for the moto 2-way radio system?
Most of the time the unscrambled transmission sounds like it needs to be
tuned and then some other times it is like a patterned clicking sound. From
what I have read in this group and other places, I am inclined to believe that
it is some kind of speech inversion. Are there different types of speech
inversion kits out there? If so, what one would a person need to unscramble
this transmission? What's your opinion?

M2> is not necessary.
M2>

Hi, Rudy...well...the 2500 can do the same thing. Just add 400 Mhz to
the cellular freq to get the image. Make sure the radio is set for 5 khz
stepping.
BTW, the mod that I sent you will enable 30 khz stepping in the cellular
region after modification.

Jerry

Hi, David...Well, you made it! So you didn't screw up. <g>

The '46 was not capable of being programmed in the 870 region until the
mod was done. If you want to put everything back the way it was to see
that 870's can't be programmed, be my guest. :)

5908. Second Cell Phone

Newsgroup: rec.radio.scanner
Date: 1994-07-04 21:12:35 UTC
From: dwhansen@panix.com
Message-ID: <2v9u03$kq2@panix.com>
Source record: 272257

Question:

Can a second cell phone be programmed to the same number as my first one? In other words I would have another just like an extention phone in the house. I understand that this is done by criminals and they piggyback onto a subscribers bill without his knowledge. I want to do basically the same thing, but I would be paying for the second phone's calls.

Question 2:

Can a cell phone be made to act as a scanner and receive other traffic on the frequency? Seems to me if I could make the phone just monitor the different channels, I could use it like a receiver.

Thanks... David W. Hansen

From: media2k@aol.com
Message-ID: <2va9ia$hue@search01.news.aol.com>
Source record: 272260

Does anyone know if such a scanner exists that has an alpha-numeric
display that allows one to enter text to be displayed along with
the frequency?

For example, I could enter 465.6250 into a bank and program the
scanner to display "Milpitas PD Channel 1" on the LCD display?

If such scanners exist, could someone please privide me with the make
and model (prefer hand-held units) so I can weigh these models
against
the Bearcat 2500XLT that I'm about to purchase?

I would appreciate any E-MAIL'ed info about this. Thanks!

The units I can think of are

AOR AR8000
Uniden BC8500
Uniden MR8100 (that one designed for public service)
There was an old Bearcat - 250? 350?
The Yaesu FT-11 is a 2m HT that you can program 5 alpha characters per channel
Didn't the Shinwa scanner have alpha display?

The only one really worth consideration is the AR8000.

You should look at the Bearcat 8500XLT for a base application, or for the mobile, the Uniden MR8100. Both of these radios are not triple conversion so they may pick up unwanted images. If you'd like to get daring, you can get a Radio Shack PRO-2006 and modify it to use with a computer. There are also interfaces for the ICOM R-7000 and R-7100.

Others have posted info about newer units (incl the AOR800 for which I
hope someone will post a report about). There was also a Bearcat 350
that came out in the early '80s.

If someone offers to sell you one, see if you can take it home for a test
drive. Most had *severely* buggy firmware.

Nice idea, nice box, bad execution.

Yes it can, but it is illegal due to cellular carrier policies. If you do
program a second phone, ie; your wife's car, and both happen to initiate
or ppick up a call, the cellular carrier's computer will lock out your
number (at least that's what happens here in Maryland).

5922. PD trying to discourage scanners?

Newsgroup: rec.radio.scanner
Date: 1994-07-05 15:23:55 UTC
From: mconner@rain.atms.purdue.edu
Message-ID: <CsH43v.LvC@mozo.cc.purdue.edu>
Source record: 272270
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Recently I've been hearing some "interference" on the local (Lafayette/Tippecanoe Co IN) 800 MHz trunk that is used for public safety agencies.

At first I thought it was someone trying to jam the police frequencies, but several things make me think otherwise. The noise is a series of squawks, almost like a mike keying on and off a few times. The noise alternates between two of the five repeater output channels. However, it never steps on an existing conversation, and no conversations are ever started on that channel while the beeping is in progress. This makes me think that the controller knows when this is going on and directs the other radios around it. Since conversations do take place on those two channels, you can't lock them out without losing quite a bit of what's going on.

It definitely does discourage scanning, as you either have to lock those channels out or put up with an annoying "squawk squawk squawk" ever 5-10 seconds.

I don't think it's a fault in their radios, as it's been going on for two weeks now and doesn't seem to interfere with their radio traffic. Anyone else heard something similiar on the trunked systems they listen to, or heard of tricks like this to discourage scanner listeners?

Actually, I figured out what was going on just by whistling an octave (do, re, mi, fa...) into my phone while the phone is in secure mode. What you will hear on the other end is (do, ti, la, so...). Something's getting inverted and it shouldn't be that tough to invert it back.

I have absolutely nothing to do with the product group who develops the phone - my findings are just me putsying around with my phone at home. Of all the cordless phones I've owned, the Motorola cordless is the best. Too bad my opinion probably doesn't carry much weight since I work for Moto.

I suspect that you have the A model:

My FCC ID is AA020-300, yours has an extra A.
My SN is 064658, yours has an extra A.
Your SN is kind of low for a July purchase (I got mine from Katy in
Feb or so, and look how high it is). This could just mean yours is
really old (and therefore OK), but it could also indicate that they've
reset the SN counter lately. And it's doubtful that the RS you got
it from had THAT many in stock.

If you do have an A model, it's interesting that they didn't change the
model number.

I've heard of similiar things happening with motorola trunk
systems. Some of them have the ablility to "beep" a little tune on a
channel after the conversation trunks, keeping your scanner from scanning.
I luckily only have to deal with Columbus' roaming data channel.

In article <2vbr4b$rpu@wizard.uark.edu>, plaws@comp..uark.edu (Peter Laws) writes:

Others have posted info about newer units (incl the AOR800 for which I
hope someone will post a report about):

Here's what I found in my mailbox. I spoke to someone at Scanner's Unlimited this morning and this unit should ship sometime this month, with an expected price of $800 US.
++
+++
The AR8000 is the result of AOR's long term ambition to produce a new breed
of radio receiver which combined full computer compatibility with advanced
wide-band radio receiver technology. With the introduction of the new AR8000, AOR have broken the mould of conventional radio receiver design.

At first glance the AR8000 in its static form may look no different to any
modern hand-held scanning receiver, but the similarity ends there...just as
soon as the receiver is switched on!! Initially you are greeted with the
opening welcome message on the AR8000 multi-function liquid crystal display
"WELCOME TO THE WORLD OF AR8000 RECEIVER", in a similar way to a sign on
message displayed by your personal computer. This new experience immediately
demonstrates to the new user and discerning radio listener that the AR8000
is no ordinary radio but THE NEW CONCEPT in radio design. The modern new
cabinet design measures approx. 152mm (h) x 69mm (d) x 40mm (w) excluding
projections and weighing only 350g including NiCads (but not aerial).

The AR8000 is a highly sensitive hand-held receiver boasting a very wide
frequency coverage of 500KHz to 1900MHz without gaps in the range (actual
acceptable frequency input from 100KHz). Step size is programmable in

multiples of 50Hz for smooth tuning. The all mode reception provides AM,USB,LSB,CW,NFM and WFM. As you might expect from a radio receiver of this calibre, an independent 2.0KHz SSB filter is fitted as standard and the USB/LSB modes use true carrier re-insertion with correctly calibrated frequency read-out (not offset by 1.KHz). A custom manufactured ferrite bat aerial is neatly installed at the top of the receivers cabinet to enhance receive performance when listening in population centres to Medium Wave services or when commentary is provided at aishows and motor sport events.

The highly visibility LCD is of a new dot matrix format which enables many

new facilities to be used, many of which have never been seen before especially on a hand held design. Two VFO frequencies may be displayed on the LCD simultaneously, one providing a stand by frequency available for quick transfer (similar to commercial aviation built-in radio transceivers. When frequencies are entered, ALPHANUMERIC comments may be stored along with frequency, mode & attenuator status simplifying the job or recalling and identifying memory channels.

The LCD provides four lines of display so that additional facilities may be provided and displayed at the same time, these include a signal strength bar meter and a band-scope showing band occupancy.

The AR8000 is equipped with almost every conceivable operating feature but operation remains easy thanks to a massive new microprocessor. A total of 1000 memory channels are provided which are divided into 20 banks, each having 50 channels. AOR have chosen to allocate 50 channels per memory bank (rather than the more conventional 100) based on findings that most radio listeners prefer fewer channels per bank but more banks for simplified operation. The AR8000 will search and scan at a very respectable (and fast)

maximum speed of approximately 30 increments per second. You may even
enter
"special" frequencies into memory banks where they may only be
recalled by
entering a user definable "PASSWORD"....this will stop preying eyes.

5930. Re: Scanner w/ Alpha-numeric display?

Newsgroup: rec.radio.scanner
Date: 1994-07-05 17:07:05 UTC
From: media2k@aol.com
Message-ID: <2vc3vp$35p@search01.news.aol.com>
Source record: 272179

In article <2vbr4b$rpu@wizard.uark.edu>, plaws@comp..uark.edu (Peter Laws) writes:

AR800 CONTINUED:

The AR8000 is truly a button pushers delight but operation need not be
difficult. As well as a comprehensively illustrated operating manual and UK
quick reference guide, the AR8000 has two operating modes: NEWUSER and
EXPERT. As already mentioned, the multi-function LCD provides many new
facilities but the receiver has a few more tricks up it's sleeve. Not only
can you connect the AR8000 to an external computer for remote control, you
may connect two AR8000 receivers back-to-back so that data may be copied
from one to another (small interface required for remote data access). There
are a variety of scan/search commands to link banks, scan by mode,
programmable delay scan, priority, auto memory store, step offset and a
programmable power save circuit to increase duration of operation from the
NiCads.

The mechanical assembly of the AR8000 will be a sheer revelation to any
radio engineer. Surface mount technology has been employed throughout the
receiver which is constructed of plug in modules. This will ensure the
highest levels of performance, reliability and serviceability. The AR8000
will certainly stand out in a constructional beauty contest. Keypad
illumination extends to the side panel keys and may be switched in a number
of ways. Illumination "permanently on" for mobile operation is possible. A
specially selected heavy duty regulator has been fitted to ensure the
receiver will continue to operate reliably even with the illumination
permanently selected.

MAIN FEATURES
Frequency coverage 500KHz - 1900MHz
All mode reception AM, NFM, WFM, USB, LSB & CW
True carrier re-insertion and specific SSB filter with non offset readout
1000 memory channels
20 search banks
Priority Channel
Frequency Pass
Rotary Tuning Dial
Step sizes programmable between 50Hz - 999KHz in 50Hz steps
Scan & Search speed up to 30 increments per second

Signal Strength meter
Band Scope
Backlit LCD , Keypad & side panel
Battery save facility
Separate controls for volume, squelch & dial
Attenuator
Keypad Beep on/Off
Keypad Lock
Top panel 3.5mm earphone socket
Monitor switch
Password protected banks
Programmable Scan & Search including Free, Delay, Auto, Level & Mode Select Scan List
Clone (Copy) Data facility between two AR8000
Computer Control
Tape Output
EEPROM memory backup (no battery required)
Supplied with NiCads, charger, Hand Strap, Belt Hook & screws, earphone,
seem flexible aerial, DC lead with cigar plug
Comprehensive operating manual with over 50 illustrations & quick reference

SPECIFICATIONS
Frequency Range: 500KHz - 1900MHz

Receive Mode: AM, NFM, WFM, USB, LSB & CW

Step Size: 50, 100, 200, 500Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50,
100, 200, 250, 500KHz or any multiple of 50Hz upto 999KHz

Sensitivity: 500KHz - 2MHz
SSB by field signal strength
AM by field signal strength

2MHz - 30MHz
SSB 1.0uV
AM 3.0uV
NFM 1.5uV

30MHz - 1.3GHz
SSB 0.25uV
AM 1.0uV
NFM 0.35uV
WFM 1.0uV

1.0GHz - 1.3GHz
NFM 1.0uV

1.3GHz - 1.9GHz
NFM 3.0uV
AM/SSB S/N 10db
NFM/WFM SINAD 12dB

Selectivity SSB 2.0KHz (-6dB) 7.5KHz (-50dB)
AM/NFM 12KHz (-6dB) 25KHz (-60dB)
WFM 180KHz (-6dB) 800KHz (-50dB)

Antenna Impedance 50 Ohm
AF Output (4.8V) 120mW (8 Ohm)
Power requirements: 4.8v NiCad / 6.0V Maganese / 9 - 16V DC external
Consumption: 150mA (nominal), 100mA (stand by), 20mA (Save)

Memory Channels: 50 channels x 20 banks = 1000
Pass Channel : 50 channels x 20 banks = 1000
Scan/Search Speed: Approx 30ch/per sec

To recap, briefly, I was at a local racetrack when a driver was killed.
I was also sitting in an area where a number of the drivers' families
sit.

What I heard on the scanner was a lot of requests for various types of
aid and assistance. It turned out that some of the information I heard
was inaccurate. Some were opinions from the people on the scene
about how they should deal with the emergency. These opinions could have
been accurate or inaccurate -- I don't know. The point is, I suppose,
what I was hearing was not "information." It was a lot of random radio
traffic.

To take a hypothetical situation:
If someone on the track had said on the radio that the driver was dead
and I had repeated it, I might have been the one to inform someone of the
death of a loved one. And it could have been wrong! I'd rather not be in this
position. The track had a good emergency plan in place and I think it was best
to let them execute their plan and deal with the situation. (In the incident

I witnessed, the driver's condition was never described on the radio to my knowledge.)

From my perspective, having "inside" information has the potential to take you from being a "spectator" to a "participant" in such a manner that you could possibly influence how the event unfolds. It seems to me that you accept a certain amount of responsibility if you decide to "participate."

The "squawking" or tones or even music is deliberate. It causes your scanner to stay on the current frequency while the conversation moves to another frequency. By time the "squawking" stops and your scanner resumes scanning you have missed that "great bit of juicy informantion"

Some of the trunked systems here have data users. Some may be system
status but most are things like the water dept telemetry. Motorola
scrambling sounds like white noise. It could be some add-on scrambler
but I'd suspect data.

GE systems are rumored to do things specifically to discourage scanners
but the musical tones disapeared from all three systems here at the same
time. Now it's repeater hang-time and data.

I can think of two things:

1) Your county has a GE or (ugh) EFJohnson trunking system and not a BatWing. Since I've never been exposed to the former (thank the scanner gods) and I have only 10-year-old end-user experience with the latter I'll let others comment.

2) You have a BatWing and they have set the system so that the 3600 bit/s handshake channel rotates quite often. It is sysadmin-definable as are most of the settings.

Brian Kantor posted some nice details about trunking systems 2 years ago (when this was a bad-ass, renegade group known as alt.radio.scanner). I guess I could post the article again ... I saved it.

BTW, is there anyone that would like to compare notes about Motorola Smartone trunk systems? Arkansas SP has one and there is one in <directional> Carolina. Does your state have a trunk system that has a fixed control channel?? Then you have a Smartone...

Yes, they do. Scanners are not allowed at any time during the flight.
However, if you wish to listen to Air Traffic Control, ask the captain
to patch the ATC audio to the entertainment system. They will usually
gladly put it on channel 9. Just plug in the headphones and listen.

How can we hold the scannergeek responsible when even NBC, CBS, CNN,
ABC, etc. can't keep their mouths shut about anything. Examples?
How about CNN from Baghdad? Or OJ's parade? The public wants their
info fast and unfiltered. That's why the networks are so loose-lipped
and why communications workers at events have become so cryptic and
"tight" with information.

George

*words to describe a drivers physical condition. Most of our personnel
*know not to give out information over the airwaves.

i got an insight into this Monday at the Formula Ford Festival at LRP.
one of the Ford drivers got into the tire wall hard, and the decision was
made to send him to the hospital as a precautionary measure (he wasn't
seriously injured, but definitely a bit out of it.) i had just done the
post accident examination of the car, and was talking to one of the
stewards when the decision was made to send the driver out. the steward
told me that his bell had been "rung pretty hard", and i suggested that
i felt sorry for the mechanic who was starting to work at fixing the
car (a rear corner had been taken off; they had the spares and it was
possible to get it together before the race later that day.) i allowed
as how i might go tell him not to work his but off, and the steward
quite properly informed me that i couldn't possibly do that because i
didn't know that the driver had been sent out. in other words, the
steward wasn't even supposed to tell me, a scrutineer, what was going
on -- he did so because he knew that i wouldn't blab if told not to,
and i certainly kept my mouth shut after that.

>--

Jon,

Okay, here goes:

VHF 2-6
start with channel 2 on 59.75 MHz, then up in 6 MHz steps

VHF 7-13
start with channel 7 on 179.75 MHz, then up in 6 MHz steps

UHF 14 - cellular
start with channel 14 on 475.75 MHz, then up in 6 MHz steps

Enjoy,

John

btw: Unless you have something like a Pro-200x, most RatShak stuff won't
pick them up. Get yourself an Icom, an AOR or a 200x.

Hello all! I will be going to Delaware (Rehoboth Beach) next week and would appreciate if a few of you would send me frequencies for that area (or Delaware in general).

Also, does anyone know whether it is illegal to use a scanner in your car in Maryland or Delaware?

Thanks in advance! I'll post a summary of what I receive.

I tried to get a summer job at Radio Shack about 8 years ago. During
the interview (after some AI program on a Tandy told the interviewer
that I wasn't the type of person who would take drugs or steal from the
till) I was told that I was "overqualified." The guy went on to say
that he didn't want to hire me because "If someone walked in wanting
to buy a new stereo because his made static every time he turned the
volume knob, You would suggest he try a $0.50 potentiometer first to see
if that fixes the problem." The guy then said everything was based on
commission, and it's better to sell a big stereo than some dumb little
part. Maybe that's why the people that work there will say anything
to get a nice big commission on a scanner...

Subject: Re: How does 'Trunked radio' work?
Date: 15 Jun 1992 04:30:37 GMT
Message-ID: <11h6ddINNkee@network.ucsd.edu>
References: <1992Jun13.233118.12067@ica.philips.nl>

There are several kinds of trunked radio systems; I'll describe the Motorola one since that's the kind I was trained on several years ago. The others aren't too different, I'm told.

Typically there are at least 4 channels in a trunking system. They are really repeater pairs; most often in a small system, all the repeaters are at a single location on a good hill or tall building. One channel is the control channel and continously transmits digital codes (3600 baud, if I remember right). In a Motorola system, the control channel shifts between the repeaters in the system every 12 hours to even out the wear on the equipment. Larger systems (like San Diego's 14-channel trunking system) will have multiple control channels, usually spread around different sites for better coverage.

When a mobile (or portable) is first turned on, it scans all the channels in its system until it finds the control channel. (If it can't find it, you'll get an error indication.)

When you key the radio to make a transmission (after an idle period), the radio sends a quick digital request containing your unit id and the 'call group' of who you want to talk with to the trunking controller, which is listening on the input of the repeater that is the control channel at that time.

The controller selects an idle repeater channel, and then transmits a command that tells your radio to switch to that frequency. If all channels are busy, you get an error indication. All the other radios

in the selected talk group will also switch to that frequency.

(A talk group may be everyone on your system, just a few units, or one specific unit. It's completely programmable.)

While the conversation continues, you'll all stay on that frequency. After a configured idle period (which can be short or long), you'll all return to the control channel, freeing up the repeater.

Whilst you're on the talk channel, a continuous subaudible digital code (63 baud? don't remember!) is sent to confirm that you're on the right channel and that you should stay there. It can also instruct you to switch to another talk channel or to return immediately to the control channel.

MDT (Mobile Data Terminals), alphanumeric pagers, and mobile status indicators (in service, out of service, man down, emergency, hijack, etc) can operate on the digital control channel without needing to allocate a talk channel, although in a busy police system, it's likely that MDTs have their own channel.

It is possible to poll a mobile to see if it's in service; it's even possible to reconfigure the mobile remotely in the more advanced systems. I see no reason to believe that it is impossible to remotely command a mobile to transmit, but I don't think that would be practical as an eavesdropping technique, since typically the microphone is out of the circuit unless the button on the mic is pushed, and because most mobiles have blab-off timers to prevent a wedged microphone from jamming a channel for long. It could be done, though.

The voice transmissions are normally standard 5 (or 3) kHz deviated FM, but they can be digitally encrypted if the system is so equipped. That's pretty much separate from the trunking function. (As a side note, the Motorola digital encryption is done by digitizing the signal using a CVSD coder doing the A/D/A conversion; as I recall, it's like a 12kb/s code. To me, it sounds really muffled - too low a sample rate for my taste. Obviously they had to do that to fit it into standard channels.)

I understand that the Johnson and G.E. systems work similarly, but don't leave the controller transmitting continuously. They may use different baud rates too.

To monitor a trunking system on a scanner, you pretty much have to program all the frequencies into your radio. In the US, you can get them from the public copy of the station license. However, if the system gets busy, and the idle homing timer is set short, you'll have a lot of trouble finding a specific conversation.

I think it would be really cool for someone to make a trunking decoder that could be attached to a scanner that would instruct it to follow a specified bunch of talk groups as the channel assignments took place. No doubt it'll cost a fortune.

In the mean time, the only technique that occurs to me is to get a used trunking radio and pursuade a radio tech to program it the same as one of the official radios. Whatta pain!

>is not necessary.

Image reception is usually an undesired function of a receiver but it some cases is useful. Images are common in scanners because their receiver front ends are not very selective.

To calculate an image frequency you need a couple of pieces of information. Mainly, the frequency you want to receive and the first intermediate frequency of your scanner. Multiply the IF by two and add or subract that number to/from the frequency you wish to hear. If the result is frequency you can program into your scanner, use it. Here's an example used to listen to aircraft.

My scanner is not designed to be air band programable.
I want to hear 135.4 MHz.
The first IF of my receiver (in the specs) is 10.7 MHz.

2 x 10.7 = 21.4
21.4 + 135.4 = 156.8
135.4 - 21.4 = 114.0 (won't work in my receiver)

I program 156.8 into the scanner and I should be able to hear air traffic on 135.4. Of course, I also will hear a whoever is using 156.8.

Because it is usually considered an undesired function the manufacturer may try to design some image rejection into the receiver. You might see an image rejection figure in the radio specs given in dB. Very strong signals may required for this method to work. Since cellular systems try to keep power levels low it be difficult. In the above example, I might only hear airplanes within a few miles of my receiver.

Message-ID: <2vcmu4$ejr@src-news.pa.dec.com>
Source record: 272201

For sale:

JPS NTR-1 noise/tone reducer. $100 firm, includes shipping as below.

This DSP noise reduction system lists for $169.95 and includes the manufacturers 12V external power supply ($16.00). Total list price was $185.95

This unit is 3 months old and in like-new condition. Includes all manufacturer's original boxes, instruction booklet, warranty card, and 12V power supply. Price is $100.00 firm. I'll pay 1st class US postal shipping to any location in the lower 48 states. Price refunded if condition not as described.

Works fine. I would just prefer to put the money towards a new radio, rather than a quieter radio.

Reply via email (ira@pa.dec.com) or call 415-853-2160.

Regards,
Ira

>>>You can scan cells with your old UHF TV!

>I'd like to see someone do this to this date.

>Just a plain ole' UHF TV. No attachments. Nothing.

I haven't tried it, but have heard of it. Why not? The spectrum for cellular and many other 800MHz operations was reallocated from the upper UHF TV channels that were never used (I can't remember seeing anything above channel 65). Televisions with analog tuners should be able to hear quite a bit of 800Mhz audio.

They can't use illegally obtained evidence *IN COURT*. That doesn't mean the cops will ignore it though. It could lead to other evidence (e.g., a confession).

> The story didn't mention anything about it being illegal to listen to
> cellular calls. What is the penalty for listening to cell phones
> with a scanner?

It's not illegal to listen to cell-phone calls ... yet. The only thing that IS illegal about cell-phone monitoring is the manufacture or import of radios that can do it (or be easily modified, for some arbitrary definition of "easy").

Is there any word on any revision to the Pro43's being sold in Canada?
Seems like the ones in our local Radio Shack don't list an FCC #, just:

20-300
DOC/MDC 255B163

The serial #'s are in the 084xxx range it seems, with another
distinguishing feature being an odd sticker on the box saying "3A4" (back side,
bottom right corner).

Any help appreciated!

>
> Please reply ASAP because if I can't modify it, I want to return it.

It looks as though you are the owner (perhaps short term) of a new non-modifiable PRO-43. It seems that the only way to confirm is to see if the FCC ID # ends in an 'A'. The 'A' would signify a newly approved model which translates to 'non-restorable'. It also appears that the serial #'s start with an 'A' as well.

The pre-production version I saw also had an 'A' in the model #, (20-300A), as well as the FCC # change. I am very surprised that the model number did not change as it will now be difficult for RS to keep track of stock.

One more thing - the 1000 channel RS base scanner, PRO 2035, catalog 20-460, has been FC approved. It should start to show up in the near future to replace the 2006. Your local RS will not know what you are talking about if you lay these numbers on him until it is released.

I do this all the time since I don't have a scanner that reaches up to
the cellular band. Simply hook a long wire to the UHF screws, or if
you have the VHF/UHF combination connector, simply stick the wire in
that hole (don't use that loop antenna). Tune to channel 81 (be sure
that you are in TV mode and not CATV) and you will hear all kinds of
conversations going on. Usually one conversation will tend to be
louder than the others, it seems to depend on the individual tuner.

Yup..Illegal to tune your TV to channel 81! Happy Independence Day all.

5963. OPTO-456 First impressions

Newsgroup: rec.radio.scanner
Date: 1994-07-06 00:46:15 UTC
From: mike_diaz@smtp.esl.com
Message-ID: <mike_diaz-050794165052@m11106.esl.com>
Source record: 272211

OPTO-456 first Impressions.

Last week a friend of mine received his OPTO456 for the PRO-2006. It came without the video tape mentioned in the AD, but was otherwise complete. I guess they ran out of them, or haven't finished it yet, he didn't call to ask.
The 456 hardware was fairly easy to install, it only took him about 2 hours from start to finish although he did use a soldering iron. The 9V battery compartment gets removed but the wires pass through a small hole. The instructions say to take a screwdriver and ream out the hole until it is large enough to pull the battery clip through the mangled hole. My friend chose to unsolder the wires pull the wires through the hole and solder the wires back on, which is the right way to do this, granted the plastic is thin and it shouldn't be difficult to enlarge the hole. The 456 installs on the underside of the 2006 in the large open area and fits around the transformer and butts up against the circuit board on the other side. It comes with a metal plate that covers the oval hole in the bottom of the chassis, my guess is that they radiated spurs into the underside of the RF section so they covered the opening. It *KIND OF* crimps onto the lip that borders the opening and a screw on one end holds it in place. The 456 mounts close to the surrounding metal chassis protrusions, so they supply insulating plastic u-channel that slips onto the lips that stick up around the surrounding chassis. There are also 4 foam rubber cushions 1/4" Sq that stick to the chassis as spacers for mounting. These were all needed so that no drilling for a *REAL* mounting bracket would be needed. The connections are made by un-plugging 3 connectors from the 2006 and plugging them into the 456, then another 3 cables go from the 456, and plug into the 2006. The cable from the front panel to the 456 gets stretched so tight you can almost play a tune on the pink wire, but it does fit.
The 456 installation looks very clean once completed, the green epoxy board matches the existing circuit boards nicely and looks like the GRE factory installed it. The connectors mount on the rear panel where the battery compartment used to be mounted, and the battery gets velcro"ed to the chassis sidewall (so buy a new battery). The 456 rear panel has a 9-pin D conn, an 1/8" plug for the CI-V output, and another for a tape recorder pause control. A nice looking installation from the outside too.

I got a chance to try it out today, and I must say I have mixed feelings about it. The hardware seems to be very good, but now you're at the mercy of the software control program you have to use to control the once easy to use 2006. If you're not a computer lover don't bother.
When you first turn on the 2006/456 there will be a 2-3 Sec delay before the display comes on, this is normal. If no computer is connected you have a normal 2006 but if the DTR line is asserted the computer takes over.

Operationally it is not simple to use, as it comes with the Scanstar software and a DEMO version of Scancat to control it with. If you want the fully functioning version of Scancat or the *full featured* version of Scanstar PRO, it's another $80 bucks from the respective vendors. Both S/W packages have good points and bad points and run under DOS (sorry Mac and Windows users, but they're still working on your versions, or so they claim). When the S/W takes over control of the radio, the 2006 display is blanked, so your only info comes from the S/W. I didn't get a chance to try out the DTMF & CTCSS decoding so I won't comment on it at this time. My friend said it does work, although you get occasional false decodes from voice comms.

Scancat seemed to have a "dated" user interface, one that has been around for years and is due for a MAJOR overhaul. But it offers some interesting features such as an S-meter display of signal strength, although we never did get it to work, maybe the fully functioning version works better. It did tune the 2006 and do limit searches, while displaying the freq. of tuning. As well as allow single channel tuning and limit searches previously stored in a file. It has a spectrum display feature that shows the freq.'s. that have been captured graphically, although I'm not sure how useful it is, "it shore looks purdy". I personally, just didn't care for the look and feel of the S/W as a whole, IMHO.

Scanstar standard version which is the primary control S/W that comes with the 456 had a much nicer user interface and look & feel to it, although there were many buried menu options that have to be set up before you can use the S/W. Once it was configured it was fairly easy to get it to do searches. My biggest complaint is, it just doesn't give you any information as to what freq. it is tuning during limit search until it stops on an active channel. I found this disconcerting to be staring at a blank screen that says searching in the bottom left corner until a signal is found. I like to get some feedback as to what is happening. I guess this was a compromise to get the search rate up to the claimed 50 channels/sec. I would have preferred a user selectable option to enable or disable the freq. display so that I could get some feedback as it tunes, besides with a fast 486/66 I doubt it would take much time to do the display function call.
I guess I am biased in favor of Scanstar because it just seemed to be a better looking, easier to use program. But remember I only tried the 456 for about 1-1/2 Hr's using both programs so I didn't thoroughly ring out either program. Nor have I used them before or even met anyone that has, so my view is somewhat limited.
The S/W from both companies is generic to a dozen or more different types of radios and so it is not optimized for the capabilities of the 2006/456 combination. I suspect that as time and money allows, both companies will expand the capabilities of their S/W. I see a very powerful combination here, in fact as I write this, I decided to call and order one of my own.
But alas, it is after hours here on the West coast and nobody answered, so I'll have to wait until tomorrow, but I will order one for my own use.

: listen to, or heard of tricks like this to discourage scanner
: listeners?

I was up in Albuquerque, NM last weekend (first time there with the '43). I plugged in the 800 MHz frequencies for the city out of my two-year-old copy of Police Call. Sure enough, I could hear police, but I also encountered anti-scanner tones at the end of each transmission. I'm guessing that this is a GE system, because the tones sound a lot like the "we bring good things to life" jingle. Yecch. At least El Paso's new trunked system doesn't do that (yet).

There are supposedly add-ons for the PRO-2006 that are designed to resume scanning if these tones are encountered.

T.J.

>Could you explain how you use this? Just attach the terminator with no
>antena?

The terminator attaches to the BNC jack on the R1 and the antenna plugs
into the terminator. The terminator is a series type, not the resistive
cap type commonly found at the ends of a thinnet LAN.

From: steven@sgb.oau.org
Message-ID: <CsI1GL.AuG@sgb.oau.org>
Source record: 272223

I have been reading on CompuServe that most of the PRO-43s are all gone, the only one's available now supposedly can not be modified for cellular without replacing actual chips. They have an A on the FCC ID number.

I have not yet learned the chips to change or the costs involved. Maybe the Cellular Group might know and can mod these units...

Any sources over the border in Canada unaffected by this problem? Looks like it's time to dig up their addresses again.

I have noticed an increase in comments on how to modified cellular phones to be tunable / selectable. I guess the scanner owners should start lobbying for EQUAL treatment...

We WANT laws to prohibit the importation and manufacture of cellular phones because they can be modified to act as tunable receivers removing any expectation of privacy from another cellular user!

(honey, I will be late at the office... ok, luv you... bye... click... ring hello? Yes, I've got the whole night free! What time should I pick you up?)

>800Mhz audio.

Some of us that live under cellular telephone towers don't even need a
old TV to become criminals. All of my receivers pickup these
conversations whether I like it or not. Repeated complaints to the phone
company have changed nothing.

I'm glad I don't watch much TV because it effects the video as well.
Thanks to the congresscritters, my neighbors are criminals as well.

At least there's that inner warmth to be thankful for during the winter!

I encountered this when used to live in Toronto. Their police as well as many
Ontario police depts use a system that allows for detecting the location of
transmission. Adding a closed tone squelch system (CTSS) tone board to your
scanner will ease monitoring as squelch will only open up when these tones are
detected on transmission, and not during other times. They said that this was
not intended to discourage scanning, but it made it a nuisance.

It does not matter who says what on a cellular phone, and it does not matter if they are paying for the service or ripping it off. The Electronic Communications Privacy Act of 1986 makes it illegal to listen to any communications on any frequency licensed to a cellular phone service. Period. No exceptions (unless you are involved in a law enforcement capacity).

The same code that sets up test frequencies in a PRO-46 works on a
PRO-51. Press the 2, 9, and LO (lockout) keys as you power up the
unit. THIS WILL ERASE ALL PREVIOUSLY STORED CHANNELS! The frequency
stored in channel 23 is a cellular frequency. What I did was
scan up and down from that frequency and store some of the "hits" in
the monitor banks and later stored them in other channels where I wanted
them.

P.S. Allen, please email me if you see my reply, I'm not sure if
my posting is working correctly.

Yes it works. You load the test freqs with the reset code. One of them is in
the cell range. From there, you just do a DIRECT serach of the cell band.

>How can we hold the scannergeek responsible when even NBC, CBS, CNN,

Someone needs to hold somebody responsible for something. Let's start
with ourselves. The commercial networks can (and do) do what they want,
results-be-damned, it seems. However, we are discusssing the rights,
responsibilities and acceptable behavior of scanner listeners, not those
of the networks.

The situation in the thread was one where the person with the scanner was
the only potential source of information. The networks were not a factor
according to the post.

A friend of mine purchased the above for use with his 7000 and 71. We worked with the software for about 2 hours trying various things.

My first impresion is that the code has GOT to be badly written because of the speed of execution on his 386/20mhz, 9600bps system. (18 cps TOPs) In addition certain keystrokes caused the software to become confused and list the same option twice in the menu while not listing others! IMHO this software is and still should be of the SHAREWARE variety until the quality is improved. Several times the machine LOCKED UP and had to be warmstarted. The code suppports both these radios simultaneously and ocasionaly one radio control would become "insaine". (scanning continuously never stopping at squelch) (no amount of twiddling with the options affected this problem)

I take the proceeding to imply the police are doing something that the
public should not know about. Am I wrong? What are the cops up to that
cant bare public scruitney? Are police agencies going to trunked systems
in an attempt to hide what they are really up to from anyone listening.
Sounds like trunking systems are a great way to hide whats really happening.

No I'm not a paranoid! Just wondering what we'll do in the future when
we find listening to the cops is a felony. Seig Hiel.

5997. Need help programming FT-470

Newsgroup: rec.radio.scanner
Date: 1994-07-06 16:58:39 UTC
From: N7LTD <cecil_walker@ccm.hf.intel.com>
Message-ID: <2venrn$pvh@chnews.intel.com>
Source record: 272152
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hey guys,

Do you recall how you get the FT-470 to scan out of the normal ham frequencies?
I think it was a combination of holding some buttons down while powering on,
but I don't remember for sure.

Yeah, yeah, I'll write it down this time!

Thanks,
Cecil N7LTD

>I program 156.8 into the scanner and I should be able to hear air traffic on
>135.4. Of course, I also will hear a whoever is using 156.8.

Interesting that you picked this particular example. 156.8 is marine
VHF channel 16, which is the international calling and emergency
frequency. The image, heard on a Uniden BC200, is a busy aviation
channel in this area (Oakland Center, I believe).

It's amusing to scan the marine band and hear conversations about
flight levels and localizers. The reception is surprisingly good,
considering that the marine band is FM but aviation is AM.

frequencies?

>cecil_walker@ccm.hf.intel.com

I guess we are neighbors (@ccm.hf.intel.com)!
Here are a few of the mods:

-=-

MARS Mod:

Effect: Enable extended 2m receive, 2m transmit

1) Make hard (paper) copy of all memory info
2) Turn radio off
3) Hold down up-arrow and down-arrow and turn radio on
4) Replace all memory contents

Notes: This mod wipes all memory contents. This is a "toggle"
mod in that it can be un-done by repeating the above steps.
The normal->MARS mod only wipes the memories. The MARS->
normal mod not only wipes the memories, it appears to do a
complete controller reset (see above).

Result: Receive range 130-180 MHz, transmit 140-151MHz (I
think, I haven't tried it.)

Attributed: Yaesu

-=-

Software UHF Receive Expansion:

Effect: extend UHF Rx to 500MHz without shrinking Tx range

How: Trick 470 into accepting big number in U register.

Caveat: This mod acts differently on different radios.

1) Turn the beep on. (Some, perhaps all, 470's require that
the key-press-beep function be on in order to do this.)
2) Program the frequency of 450.00 MHz simplex.
3) Set the repeater offset to zero (F/M RPT 0000) but DON'T
get out of the set mode (don't hit RPT again).
4) Turn the radio off then back on.

5) Set a "+" offset (press RPT twice).
6) Press the REV button one time.
7) The radio should now display 1450 MHz.(The radio will not operate at these frequencies. My service monitor shows that above 500 MHz the rx is very weak.)
8) Use the shifted down-arrow key to tune this frequency down to around 500 MHz (press F/M, press and hold down-arrow). Yes, this takes a while.
9) Store this in the "U" memory. (press and hold F/M until you hear two beeps, rotate tuning knob until "U" appears in upper left, press F/M again).
10) Reset the repeater offset to 5 MHz. (F/M RPT 0500 RPT)

Result: By selecting the "U" memory and the using the memory tune fuction (select "U" memory and then press MR), you can tune to the desired frequency and then store it in another memory.

Bugs: Above 500 MHz, some radios will let you tune up and down in frequency, some won't (they jump back to the ham band). Some radios will let you enter a frequency above 500 MHz on the keyboard while in memory tune mode, some won't.

Steps for setting the UPPER VHF limit to 200 MHz.

1. Program the frequency for 140.00 MHz *SIMPLEX*.
2. Press F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT twice (for a "+" (plus) indicated offset).
6. Press REV *ONE* time.
7. The radio should now display 1140.00 MHz.
8. Press F/M, then hold the down-arrow key to decrease the displayed frequency. Stop at 800 MHz.
9. Press RPT twice to select the "-" (minus) repeater offset.
10. Press REV once. You should have 200.000 MHz displayed.
11. Press RPT twice to select simplex.
12. Store this in the "U" memory. (See above steps...)
13. Press F/M then RPT then enter 0060 (600 Khz repeater offset) then press RPT again.

Steps for setting the LOWER VHF limit to 100 MHz.

1. Program the frequency for 140.00 MHz *SIMPLEX*.
2. Press the F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT twice (for a "+" (plus) indicated offset).
6. Press REV *ONE* time.
7. The radio should now display 1140.00 MHz.

8. Press F/M, then hold the down-arrow key to decrease the
displayed frequency. Stop at 1100 MHz.
9. Press RPT twice to select the "-" (minus) repeater offset.
10. Press REV twice. You should have 100.000 MHz displayed.
11. Press RPT twice to select simplex.
12. Store this in the "L" memory. (See above steps...)
13. Press F/M then RPT then enter 0060 (600 Khz repeater
offset) then press RPT again.

Have fun!

Of course, your scanner must be able to receive AM on 156.8, which
would be a little unusual. Aircraft radios from 118-135.975 use AM in
the US. Most scanners that don't receive aircraft don't have an "AM"
position and aren't able to detect AM signals.

I would highly recommend a new book "Master Frequency File", by James Tunnell and Robert Kelty. TAB Books. ISBN 0-8306-4131-9.

It includes nationwide listing for the following: FBI, DEA, SS, US Customs, IRS, US Immigration/Border Patrol, US Marshals, Prisons, NOAA Weather, US Forest Service, and Park Service.

The listings include information on channel, input/output frequency, call letters (if known), and subaudible tone. The information appears so complete, it is hard to believe the sources were not inside the govt. Get a copy while you can!

List price $29.95, available through your local book store.

Source record: 272155

I notice a growing interest in this new scanner from AOR in the past couple of days.

I will have one these radios on loan from AOR (UK) for a while soon. I have been asked by AOR Japan to write a DOS utility to configure the factory presets for AOR national distributors.

I will have the opportunity to play with it while it is here. There are a few models in circulation here in the UK, but I am likely to be one of the first to see it in the flesh.

Although I am working on a job for AOR, I am NOT on their payroll and can take an unbiased look at the radio. I will post a review just as soon as I have had a chance to play. Is there anything anyone wants to know in particular? I have the chance find out if there is.

OPTO-456 Follow-up

I called and ordered my own 456 interface board today, and I found out some useful information about it. The video is no longer included with the package. They said that it was too confusing for the first group of users, apparently there was no manual at all with the thing when they first started shipping, *ONLY* the video. In thinking about, it my TV is in the living room and my bench is in another room, so a video version of a manual would not be much help. They threw together a manual and shipped that, but now they are working on a new improved manual that should be completed in a few days.
The control software that comes with the 456 (Scanstar) is neither the Scanstar standard nor the professional versions of the program, but a special version just to support the 2006/456 unit. Apparently there are features left out, that are standard in the full blown versions. Since they were left out I don't know what is missing.
Thats all for now.

Good listening

Watch how you edit the attributions, Michael! I was the one who wrote the "fast and unfiltered" line, not Peter. He may or may not agree with it!

Like it or not, _we_ are the "general public". Some of us (the majority, hopefully) generally react in a mature fashion to the information they receive. Others do not and can be seen rushing to the scene of the action. This holds true at races, sporting events, natural disasters, and other happenings. Some like being in the action enough that they become firemen, paramedics, policemen, etc. Others find useful things to do on a volunteer basis. Others simply gawk.

I would not be thrilled if some self-appointed "mature" person decided what the "general public" could and could not be exposed to. I probably fall into their definition of "general public", and they into mine.

Does anyone out there have a copy of Manual for SBE 4CH. crystal scanner Model SBE-10SM. I'm trying to figure out the formula for the crystal. I have a feeling that it is the same as regency scanners. This unit is a UHF 450-512Mhz only scanner. Even if you have other SBE models that have formula for UHF band, that would help too.

Thanks in advance..

FST

What does this shit have to do with radio communications? Then the little faggot who posts it has to hide behind an annonymous id. Sure I'd like to correspond with these little faggots, but letter bombs are as illegal as a cellular capable scanner.

6017. CPU/PROM Chips & Info Needed!

Newsgroup: rec.radio.scanner
Date: 1994-07-07 01:30:54 UTC
From: steven@sgb.oau.org
Message-ID: <CsJqvJ.J42@sgb.oau.org>
Source record: 272080
Cross-posted to: alt.2600,rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

I am looking for sources of the CPU and PROM chips for cellular-capable scanners. If anyone knows how they were changed to be no longer easily modifiable -- I'd appreciate some feedback.

It is my opinion that all that changed was the chip(s) used. Since the non-blocked chips are used in the international versions I would imagine they are STILL MANUFACTURED.

Since the dumb, stupid twits in the government made this law, it leaves only two choices:

[1] Order from overseas and pay the customs duty.
[2] Order in the chips as spare parts and repair our scanners!

While I am surprised no-one has done it yet, it is NOT against the law to package up the chips, parts, instructions and sell them to radio hobbiests to repair their own scanners to cover the FULL 800 mhz band. I mean Radio Shack could bag these as kits of parts and resell them!

Why is this not occuring? Are we lacking interested hobbiests?

The law does NOT prohibit ANY of the following:

[1] Manufacturers selling the individual chips and instructions to restore the omitted frequency ranges. They could say the ranges were omitted in order to obtain FCC certification.

[2] Raw materials such as chips, semiconductors, and even subassemblies (which are NOT restricted by the FCC or any other government agency). This is why the Opto-456 can permit a non-modifiable Pro 2006 scanner to receive cellular.

[3] Manufacture of kits (see above) for users to assemble. Keep in mind that users do NOT need FCC certification and are not considered manufacturers if they are not made for purpose of resale.

[4] Servicing a scanner and or making modifications to a prior owned scanner under a contract for certain work to be performed such as adding cellular via replacement of chips is also NOT illegal since the scanner was previously manufactured or imported as an approved product. Admittedly, the changes would cause it to lose that certification, meaning you could not legally resell the modified version, but the law does NOT prevent you from owning or using a none certified scanner. The fact that it becomes no longer certified thus

becomes insignificant now.

I am posting this message to alt.radio.scanner, rec.radio.scanner, and also alt.2600 because the folks in alt.2600 seem to always have the information first, for example with cantor and seigel, they had the scoop on name, address, phone numbers, network data, right down to the fact they had a nice pool to be nicely attacked with all sorts of "vandalism" (since they had already electronically vandalised the network with advertising, it's an appropriate recourse). Another example, cellular phones, this is where you can find out how to alter them, change them, reprogram them, and yes, use them as cellular RECEIVERS (anyone listening out in bonehead government-land??? We need to BAN CELLULAR PHONES!!!)

Anyhow, this is an open solicitation for ALL available information on names, addresses, phone numbers, of where spare parts for the various popular scanners can be obtained, bought, etc, and if anyone knows what the changes are in the newer not easily altered units? I suspect just a change in the chip used.

I figure if I can't extract the info from the rec.radio.scanner section, perhaps one of the electronic hackers in the alt.2600 forum will have done this already.

Back when it was add the resistor, move the diode, remove the diode, change the diode, the modifications were out within DAYS of the units being available.

Now all the geniuses who provided this information seem to have simply given up or quit. I really do not get it. I'd imagine it would be a bigger challenge now than before. I'd also imagine the radio amateurs who are known for their homemade equipment and mods would not have wasted any time in determining what changes would be needed.

This does not appear to have happened yet. I do not understand why.

I do not buy the brainwashing that "it can not be done". Just because the federal government bought the story from the manufacturers does not make it so. A company COULD go into business restoring the cellular by replacing the chips. The law would not prevent that from being done. The scanners met the letter of the law by not being easily modifiable. So, maybe they are hard to modify. I still do not see why everyone has given up.

I'll admit its easier to dump the U.S. sales of scanners and buy from overseas, but I do not see why no-one has investigated what it takes to fix these broken scanners that are missing two slices in the 800 mhz band.

It is not against the law to sell the parts or modify a previously owned unit (you are not manufacturing it, as it was already manufactured, you are not importing it either, you are professionally modifying it for cellular as a contract service being performed).

Anyone have any answers? I would appreciate any information, addresses, names, phone numbers, tips, prices, part numbers for what needs to be replaced in these broken scanners (such as the Pro-43 As!) Also I am still working on the directory of international dealers. If you wish to pass

along information on them as well (name, address, phone numbers, fax and voice if possible, charge cards accepted), I'd appreciate it.

Please e-mail this information to the account:

scaninfo@sgb.oau.org

I have had it created for the purpose of data collection.

I will share the results with everyone when I have them compiled. Please do not think because "someone else" will pass the info along, you do not have to. I do not mind duplicate information... I'd appreciate everyone's help. If we work together, we can have even the latest FCC approved non-modifiable scanners receiving cellular in every hobbiest's hand!

All constructive comments would be appreciated.

Thank you for your assistance,

Steven

Source record: 272167

I am interested in a wide range scanner antenna that will adequately cover from 40 Mhz through 950 or so. I am looking for the least expensive antenna with the best gain characteristics. Receive only, to mount on an existing mast right below a 450 Mhz repeater antenna (is that a bad idea?) I have pretty much narrowed my selection to the various "discone" style antennas and the Channel Master "MoniTenna" and its close relative the Antennacraft "Scantenna".

Any comments on the value of one over the other? My understanding is that the Discones have a flat unity gain or worse across the bands, while the MonitTenna has positive gain in all of the bands.

Does any mail order dealer carry the MonitTenna? I can special order it from something like $45 from a local dealer.

Bob,

Down in Corpus Christi, they have a GE system that plays the little
"we bring good things to light" theme. I hope it crashes and burns on
them because the cops think it's funny that law-abiding citizens can't
listen to their tax dollars at work. It really (expletive verb) me
off that they take such an attitude. All I wanted to do was find out
where accidents were so I could stay the hell outta their way instead
of getting stuck in traffic behind a bunch of rubberneckers.

Tom,

This opinion of RatShak "salesmakers" is precisely why, when I worked
there for a couple of years (p/time) I would _A L W A Y S_ wear my little
ham radio nametag underneath the RS tag. It was amazing how many people
would see that tag and walk right past the mgr and come to talk to me. I
had finally had enough during my second Christmas with them. They cut the
commission rates for their staff on the Friday after Thanksgiving (at that
time from 6.75 to 5.5%) because "you're going to make lots of easy sales
that you wouldn't get, anyway." Rates went back up after New Years. The
moral of THAT story is that if you find a salesman you like, do him a big
favor and buy from him before Thanksgiving. He probably isn't allowed to
tell you that.
Most of the store managers I knew weren't like you described. However,
the ones who went on to become district managers were.
Just my opinion (certainly NOT that of Tandy Corp.!)

John

6030. Motorola 'Secure-Clear' Cordless Phones (repost)

Newsgroup: rec.radio.scanner
Date: 1994-07-07 05:43:26 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <2vg4lu$e78@umcc.umcc.umich.edu>
Source record: 272172
Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.privacy,alt.toys.hi-tech,talk.politics.crypto

In the last several weeks, I've noticed some questions &
discussion concerning Motorola's 'Secure-Clear' line of cordless phones.
Below is a REPOST of something I originally wrote & posted a few years
ago. I assume Motorola is still using the voice-inversion technology for
their 'Secure-Clear' line, although I'm not sure if they're continuing to
misinform the public about the level of protection
offered by its primitive & weak transmission-security method.

****

"Why a Motorola Cordless Phone?"

"Cordless phone eavesdroppers are everywhere" says pro golfer Lee
Trevino, spokesman for Motorola. "But with my Motorola Secure Clear
Cordless Phone, my private conversations stay private."

So says a glossy brochure (# BA-81) that Motorola's Consumer Products
Division (telephone # 800/331-6456) distributes to promote their new
'secure' cordless phone product line. When I first read the cover of the
brochure, I said to myself, "Wow, I wonder what sophisticated technology it
must use?" Motorola has been developing and selling secure voice & data
systems, from DVP & DES up to the current 'FASCINATOR' algorithm for
classified military & federal government secure voice for many years.

Page Two of the slick brochure has some rhetorical questions and answers:

****
Why Motorola Cordless Phones?

Q. What is meant by Secure Clear?

Secure Clear is an exclusive technology that assures you no
eavesdroppers will be able to use another cordless phone, scanner
or baby monitor to listen in to your cordless conversations.

Q. How difficult is it to eavesdrop on someone's cordless
conversation?

It's not difficult at all. Simply by operating a cordless
phone, scanner or baby monitor on the same channel as you're on, an
eavesdropper can listen in. Security codes alone DO NOT prevent
eavesdropping.

Q. What are security codes and what do they do?

Security codes allow the handset and base to communicate with
each other. With the Secure Clear cordless phone, one of 65,000

possible codes are randomly assigned every time you set the handset in the base. This means that a neighbor cannot use his handset to link with your base and have phone calls charged to your phone number.

Q. Describe the basic difference between Secure Clear and security codes.

Secure Clear protects against eavesdropping. Security codes prevent the unauthorized use of your phone line. Usually all cordless phones have security codes, but not both.

Q. What is the purpose of the Secure Clear demo?

The Secure Clear demo is a unique feature of Motorola phones that allows you to actually experience what an eavesdropper would hear when trying to listen to your conversation. By pressing the SECURE DEMO button on the Motorola phone, you and the person on the other end will hear the same scrambled noise an eavesdropper would hear.

****

Hmmm... I went to the Motorola Secure Clear cordless phone display at a Sears store, took a deep breath, & hit the demo button in order to hear what the "scrambled noise" which would protect a conversation from eavesdropping sounded like. White-noise like that of a digital data stream? Rapid analog time-domain scrambling? No, the scrambled "noise" sounded like inverted analog voice. That's right, they're using the 40 or 50 year old (3kHz baseband) speech inversion system --the same one which they stopped marketing for their commercial two-way radio gear about a decade ago-- to make Lee Trevino's & other ignorant people's "private conversations stay private."

For those of you not familiar with speech inversion, it simply flip-flops the voice spectrum so that high pitched sounds are low, & vice versa. It sounds a lot like Single Side Band (SSB) transmissions, although it is somewhat tricky to get a SSB receiver to decode speech-inversion scrambling. Prior to 1986, several companies -- Don Nobles, Capri Electronics, etc., sold inexpensive kits or scanner add-ons that could be used to decode speech inversion. Several electronics magazines also published schematics for making your own from scratch, at a cost of about $5. After the Electronic Communications Privacy Act of 1986, it became illegal to decode or decipher encrypted communications which you weren't a legitimate party to, so the standard practice of selling these quasi-legal products as 'experimental kits' or 'for educational purposes only' became common.
Today, some companies will not specifically sell a 'speech-inversion descrambler,' but instead market a 'speech inversion scrambling system' which means the kit will encode as well as decode speech inversion, although most people buy them simply to hook up to their scanners & monitor the few public safety agencies and business that (still) use speech-inversion

scrambling.

Yes, technically, it is a felony for you to use a speech-inversion descrambler to monitor these Motorola 'Secure Clear' cordless. Or for that matter, the new Radio Shack DUoPHONE ET-499, cordless phone that also depends on speech-inversion for privacy protection. The public utility of the ECPA has been argued about ever since before it was enacted. It is rather obvious that the ECPA was pushed upon the ignorant, money-hungry Congress by the powerful (& wealthy) Cellular Telephone Industry Association (so the CTIA could propagate misinformation to the public, but that's another story...). I also realize that the 46/49MHz cordless phone channels are apparently allocated for analog-voice only.

Despite the ECPA, it is unconscionable to me that Motorola --who surely knows better-- would produce the slick brochure & specifically market the 'Secure Clear' line as being invulnerable to eavesdropping. Their wording unequivocally gives the impression that the 'Secure Clear' conversations are secure, not only from other cordless phone & baby monitors, which have several common frequencies, but also against communications hobbyists with scanner radios.

It is bad enough that many public safety officers still think that by using the 'PL' ('Private Line,' also known as CTCSS) setting on their Motorola two-way radios, no one else can listen in. While the 'Private Line' fiasco might be attributable to misconception on the part of the radio users, in my opinion, Motorola's Consumer Products Division has to know that there are thousands of scanner monitors who have the technical ability to defeat the speech-inversion 'Secure Clear' system. A Motorola representative at the 1992 Summer Consumer Electronics Show in Chicago confirmed this to me, with a smirk on his face.

There's a big difference between Motorola's aforementioned wording & that of Radio Shack's on page 3 of their 1993 catalog:

New! Voice-Scrambling Cordless Telephone
DUoFONE ET-499. Cordless phones are great.
But since they transmit over the airwaves,
your private conversations could be
monitored. Now you can enjoy cordless
convenience with voice scrambling for
added [emphasis theirs] privacy protection --
frequency inversion makes transmissions
between the handset and base unintelligible...

It's not "Motorola should know better." Motorola DOES know better. Otherwise, they wouldn't be spending time or money on truly 'secure' (based on current technology, of course) communications and transmission security systems for the government.

I sure am thankful that our federal government & military users of secure-mode communications systems don't rely on Motorola's marketing department to provide factual information as to the level of security

provided by Motorola equipment. Too bad that for the most part, the public does.

For anyone looking for a cordless telephone that offers a decent level of privacy, take a look at some of the new cordless phones that use the 900MHz band. Most of the new ones not only use CVSD digital voice for the RF link, but also direct-sequence spread spectrum. By no means are these phones secure ('encoded,' yes, but 'encrypted,' generally not), despite some of the wording in their owner's manuals. Some of the Tropez 900 models actually seems to generate a very weak analog harmonic in the 440MHz spectrum, but you'll still be a lot better off than poor Lee Trevino!

>Shack could bag these as kits of parts and resell them!

You won't see Radio Shack do anything that even comes close to what you want.
Remeber, RS is the company that pulled all of its double conversion scanners
off the market in New Jersey because word got out that cellular images could
be heard on these scanners. They also supported the ECPA if I remember
correctly.

If you order a new micro from RS they will send you the one will cellualr
blocked. You will have to order your scanners and parts from some other
country like Canada.

While I agree with you, I think the issue will die down as more digital
cellular is used. This will put an end to cell monitoring for most people
(although with the advent of DSP/sound cards for the computer, new
possibilities may open up).

IMO, cellular monitoring is one of the most boring aspects of scanning anyway
(except maybe at 3am).

6035. Pro 2026 questions

Newsgroup: rec.radio.scanner
Date: 1994-07-07 11:10:31 UTC
From: tgollin@andy.bgsu.edu
Message-ID: <tgollin-070794141031@m32-34.bgsu.edu>
Source record: 272101

Hello all,

I am a newby to this group, and i have a couple of questions. I own a pro 2026 and after reading about other scanner mods, does the 2026 has any mods needed done to it? Or is it good the way it is? I think i can pickup cellular freqs', the scanner goes all the way up to 950 Mhz. Where are all of the cellular freqs' located? (not like i would listen to them because it is illegal) i just want the cell freqs' so i can avoid them, so i can't get in trouble.

Is there anything i should know about the 2026? Are scanners illegal in VA, WVA, and North Carolina? What is the best antenna to use with the 2026? Answer to any and all questions would be app, post or email fine.

>

A non-intrusive fiber tap is an absolute reality, but it does not cost
$30, and it is not trivial.

Normally, most of the light in a fiber is internally reflected. If you
bend the fiber too much, it will start to leak out, providing a drop that
is detectable.

But, it is possible to bend the fiber 'just the right amount' so that an
undetectable amount of information is not internally reflected -- it is
this information that forms the tap. It needs to be amplified, but it
forms a valid tap.

This was documneted in one of the CACM NewsBytes some years back.

6041. BC8500XLT poor Air Freqs Reception

Newsgroup: rec.radio.scanner
Date: 1994-07-07 13:54:18 UTC
From: tbohr1@ed8751.pto.ford.com
Message-ID: <2vh1ea$edq@ef2007.efhd.ford.com>
Source record: 272087

My brother-in-law bought a BC8500XLT and hooked it up to his roof antenna
and was disappointed w/ the aircraft frequency reception quality.
The signals he gets from the tower are weak and also some static
is audible also. When using the small telescoping antenna that
came w/ the unit. the problem was even worse, introducing some hi-pitched
squirelly noise that seemingly came from inside the unit. Signals
from the planes themselves are OK.

The comparison we used were his RS Pro2006 and my BC890XLT using the same
antennae, external speakers, etc. both of these units gave good reception
on all air freqs.

Anyone know if this is inherent in the design (triple conversion)
or is there a mod to improve this somehow? thanks.

In <CsJqvJ.J42@sgb.oau.org> steven@sgb.oau.org (Steven Bradley) states:

|I am looking for sources of the CPU and PROM chips for cellular-capable
|scanners. If anyone knows how they were changed to be no longer easily
|modifiable -- I'd appreciate some feedback.

|It is my opinion that all that changed was the chip(s) used. Since the
|non-blocked chips are used in the international versions I would imagine
|they are STILL MANUFACTURED.

|Since the dumb, stupid twits in the government made this law, it leaves
|only two choices:

| [1] Order from overseas and pay the customs duty.

However, this is probably restricted for certain scanners that default
their scan increment to 30Khz. European cellular apparently scans in
25Khz steps, so you are probably restricted to North American countries
(What do South American countries use? North American cellular standards?)
Are there other areas of the world that use 30Khz increments?

| [2] Order in the chips as spare parts and repair our scanners!

Can the newly-imported AOR-1000s be reprogrammed via jumpers and
keyboard strokes as printed in Bornestein's "Guide to the AR-1000?"

> Tim Tyler

The Tropez model I have does generate several weak signals in the 400
MHz band. I have not been able to receive these further than 20 to 30
feet away. The handset seems to generate a lot of signals. Even when
the signals are full quieting, the voice on the signal is very weak.
In my opinion, the Tropez is fairly secure as far as analog harmonics
go. There are several things I don't like about the phone. It beeps
and has tremendous static when changing channels sometimes.
Occasionally, it has unexplained static. The battery life is short
because the handset is constantly communicating with the base to see if
it is out of range. I wish there were a way to disable this
feature. Once, I thought I heard another conversation on my phone.
I am curious if it was decoding someone elses signal on my frequency.
I suppose someone else could pick up their phone and have it stay on my
frequency if their base unit thought the frequency was relatively
clear. The conversation didn't sound like typical line interference
but rather like someone else down in a barrel or something. One other
thing I don't like is that the handset is heavy. It uses more
batteries than most phones too. The real advantage to this phone is
its clarity over a great distance. It works much farther than 46 MHz
analog phones and is much less expensive than most other 900 MHz
phones. Occasionally, mine does not ring. I've figured out that if my
line is loaded down to about half the recommended ringer equivilence,
the Tropez gets finicky about not wanting to ring. Strange.

>BTW - My Pro43 is my first scanner, and I **LOVE** it.

Please forgive me if this shows up more than once. I posted it
yesterday, but that news server has not shown any new articles
since, so I figured it must not have gone out. After switching
servers, I'll give it a go.....

The same code that sets up test frequencies in a PRO-46 works on a
PRO-51. Press the 2, 9, and LO (lockout) keys as you power up the
unit. THIS WILL ERASE ALL PREVIOUSLY STORED CHANNELS! The frequency
stored in channel 23 is a cellular frequency. What I did was
scan up and down from that frequency and store some of the "hits" in
the monitor banks and later stored them in other channels where I wanted
them.

P.S. Allen, please email me if you see my reply, I'm not sure if
my posting is working correctly.

>Question 2:
> Can a cell phone be made to act as a scanner and receive other
>traffic on the frequency? Seems to me if I could make the phone just monitor
>the different channels, I could use it like a receiver.

This questioned was asked of me before. At the time, last year, it was not
possible to have the same number in two cellular phones...at least not
legitimately. A cellular phone number is tied to the phone's electronic
serial number or ESN in both the telephone and the carrier's network. The
situation you mentioned with criminals piggybacking onto your ESN will cause
problems if both phone come up on the air at the same time. The system may
lock you out when that occurs. Then you're without service until you and
the carrier sort it out and teh criminal moves on to another number.

On your second question. Yes. Many cellular phones have special service
modes that will allow you to activate the phones receiver as a monitor.
There are usually other service test modes that can be activated.
These features are only intended to be used by qualified technicians in the
course of servicing and testing the radios. They require special access codes
provided by the manufacturers to authorized service persons. You really need
to know what your doing or you may cause trouble on the network.

The idea that a plane would be brought down by puny scanner emmisions is far fetched, indeed.

The idea that navigation equipment might be effected by the same emmisions is certainly possible. The plane may not turn and fly the wrong way but any effect that your reciever has on the aircraft's systems would likely be classifed as harmful interference. The airline and PIC are well within their authority when they try to reduce potential problems.

Hi,

I have a Realistic Pro-39 scanner for sale. It is approximately 2 months old,
but I have used it very infrequently. It is in like new condition. It's
features are:

o Wide frequency coverage. (See RS catalog, or email me)
o 200 channel memory.
o 10 monitor banks.
o Search/scan.
o Cellular modified.
o AC adapter/charger.
o Manual.

I have had no problems with this scanner, it was just an impulse buy for me,
and now I am strapped for cash. I paid about $350 for the whole package,
but am willing to part with it for $200 (including shipping within the U.S.)
I would like to receive payment in the form of a money order 'up front.'

Please e-mail me, or I can be reached at the following address:

Not exactly true. Many AMSS systems have fixed control channel. Even the
old
trunked systems that do rotate control channel can be programmed to not
rotate control channels. The current SmartZone Systems do allow for
rotating control channels. From a scanner's point of view, there really is

no way to tell between a SmartZone System and a non-SmartZone system.

I have performed the 800mhz diode clip to my pro-37, I would like to know
if there are any more mods available?
Also, is there an FTP site for mods?

Guess I should keep this radio, 800mhz capable scanners are getting scarce!

I'm not sure someone from the Cellular division should be considered an expert in trunking. I don't believe there are a bunch of engineers sitting around deliberately trying to throw off scanners by inserting tones into their protocols. In fact, we are so busy implementing new features and functionality into our trunking systems, adding tones to the ends of calls just to throw off scanners is a waste of our engineering resources. There are also better ways to discourage scanners (see below)

Many folks think that the channel hopping is to throw off scanners. It is not!
The reason calls get steered to different channels is to best utilize the resources available for all the calls happening at once. The fact that it interrupts scanners is a byproduct, not the intent of the design.
Similarly
the squawks or tones or beeps are there for a reason (protocol, base station
identification, data, whatever) and the fact that they throw scanners off is a byproduct (I can't speak for GE systems) not the intent.

As for "police are doing something that the public should not know about" there are many situation where the police want to be secure from the public.
A simple example is a drug bust - if the police are planning a drug bust, and

they transmit the address of the bust over the air, they don't want the drug dealers to be alerted and flee before the bust.

Police are not going to trunked systems because they can throw off scanners.
They are going to trunked systems so many groups (departments, precincts, fire dept, city/state officials, etc) can better utilize the limited number of
frequencies available from the FCC.

Normal trunking systems are not really that secure (you can still hear analog audio with a scanner) unless you add secure encryption (to scanners it will sound like hiss). Also, everything is now becoming digital (the intent here is to supply data, clearer audio, less crosstalk between channels,
more channels, etc) and as a byproduct all the old analog scanners won't work.

Sorry for the delay in replying. I have not taken any corrective action
other than "waiting it out." Eventually, often days later, after numerous
on/off cycles, I turn the rig on and it works fine. Happens with alternate
power sources and in multiple locations. It is not overload, although even
when operating "normally" the unit gets clobbered by paging services,
especially in the 453 MHz range. How is Reset accomplished on this radio?

There is a "print redirector" out there somewhere. I saw a TSR YEARS ago that would do this. No clue on where to get it now or what the name of the thing was. I think a company call "White Crane" used to make a utility comercialy that did this also.

I'll see if I can't dig up the shareware for you.

I just heard a strange transmission on 311.00 Mhz (Stratcom Primary). The transmission constisted of a series of letters and numbers about five minutes long. No other verbal communication occured. The sender had a callsign of 'Mayberry' and was attempting to contact a 'Raymond 4' Does anyone have an idea of what this transmission might have been used for or where it may have originated from etc. Any ideas would be appreciated. P.S. I live in Lincoln, NE which of course is only 50 miles from Offutt AFB in Omaha. (Former SAC headquarters)

>>Thanks in advance.

There's no law against mobile scanners in CA. All there is is laws against USE of the information recieved. Along with a law against cellphone and cordless phone monitoring

Section 636.5 Wrongful Interception and Divulgence of Police Radio Communication.

Any person not authorized by the sender, who intercepts any police radio service communications, by use of a scanner or other means, for the purpose of using that communication to assist in the commission of a criminal offense or to avoid or escape arrest, trial, conviction, or punishment or who divulges to any person he or she knows to be a suspect in the commission of any criminal offense, the existence, contents, substance, purport, effect or meaning of that communication concerning escape from arrest, trial, conviction, or punishment is guilty of a misdemeanor.
Nothing in this section shall preclude prosecution of any person under section 31 or 32.
As used in this section "police radio service communications" means a communications authorized by the Federal Communications Commission to be transmitted by a station in the police radio service. Leg.H. 1976 ch. 1129, 1991 ch. 515.

Sec. 632.5. Intercepting or Receiving Cellular Radio Telephone Communication.
(a) Every person who, maliciously and without the consent of all parties to the communication, intercepts, receives, or assists in intercepting or receiving a communication transmitted between cellular radio telephones or between any cellular radio telephone and a landline telephone shall be punished by a fine not exceeding two thousand five hundred dollars ($2,500), by imprisonment in the county jail not exceeding one year or in he state prison, or by both that fine and imprisonment. If the person has been previously convicted of a violation of this section or Section 631, 632, 632.6, 632.7, or 636, the person shall be punished by a fine not exceeding ten thousand dollars ($10,000), by imprisonment in the county jail not

exceeding one year or in the state prison, or by both that fine and imprisonment.
(b) In the following instances, this section shall not apply:
(1) To any public utility engaged in the business of providing communication services and facilities, or to the officers, employees, or agents thereof, where the acts otherwise prohibited are for the purpose of construction, maintenance, conduct, or operation of the services and facilities of the public utility.
(2) To the use of any instrument, equipment, facility, or service furnished and used pursuant to the tariffs of the public utility.
(3) To any telephonic communication system used for communication exclusively within a state, county, city and county, or city correctional facility.
(c) As used in this section and section 635, "cellular radio telephone" means a wireless telephone authorized by the Federal Communications Commission to operate in the frequency bandwidth reserved for cellular radio telephones. Leg.H. 1985 ch 909, 1992 ch. 298.

Sec. 632.6. Intercepting or Receiving Cordless Telephone Communication; Penalty; Exceptions

(a) Every person who, maliciously and without the consent of all parties to the communication, intercepts, receives, or assists in intercepting or receiving a communication transmitted between cordless telephones as defined in subdivision (c), between any cordless telephone and a landline telephone, or between a cordless telephone and a cellular telephone shall be punished by a fine not exceeding two thousand five hundred dollars ($2,500), by imprisonment in the county jail not exceeding one year or in the state prison, or by both that fine and imprisonment. If the person has been previously convicted of a violation of this section or Section 631,632, 632.5, 632.7, or 636, the person shall be punished by a fine not exceeding ten thousand dollars ($10,000), by imprisonment in the countyjail not exceeding one year or in the state prison, or by both that fine and imprisonment.
(b) In the following instances, this section shall not apply:
(1) To any public utility engaged in the business of providing communication services and facilities, or to the officers, employees, or agents thereof, where the acts otherwise prohibited are for the purpose of construction, maintenance, conduct, or operation of the services and facilities of the public utility.
(2) To the use of any instrument, equipment, facility, or service furnished and used pursuant to the tariffs of the public utility.
(3) To any telephonic communication system used for communication exclusively within a state, county, city and county, or city correctional facility.
(c) As used in this section and section 635, "cordless telephone" means a two-way low power communications system consisting of two parts-a "base" unit which connects to the public switched telephone network and a handset or "remote" unit-which are connected by a radio

link and authorized by the Federal Communications Commission to operate in the frequency bandwidth reserved for cordless telephones. Leg.H. 1990 ch. 696, 1992 ch. 298

I tried it and it works just like they say. All you can do, though, is direct search from a programmed channel. You can't do limit searches. However, you can program various frequencies at different points along the cellular band to avoid the data areas. If you're serious about monitoring cellular, then forget the '51. I get a lot of cellular images from about 890 MHz on up.

I personally find monitoring cellular extremely boring, but I like to know I can do it if I really want to, so this is a good handheld for me. I like the small, sleek design, and it's twice as fast as my 2006. It's cheaper than the '43. On the downside, it is not a triple-conversion like the '43, it can't pick up CB nor 175-405 MHz, and it doesn't have AM.

If you use the test mode to get the cellular, do it when you first get it, before you program anything, because everything in memory is erased.

Sorry about that. My apologies to Peter too. Looks like I
nuked one too many lines.

> Like it or not, _we_ are the "general public".
I count myself as one of them. I am John Q Public, #xyz.

> Some of us (the majority, hopefully) generally react in a mature
> fashion to the information they receive.
I admit to not being omnicient but by and large, what I have
viewed, counters this. Maybe I am pessimistic, maybe I have
only seen a bad slice. But from here, that's what I think I see.

> I would not be thrilled if some self-appointed "mature" person decided
> what the "general public" could and could not be exposed to. I probably
> fall into their definition of "general public", and they into mine.
Yes, I agree. Please understand, I do NOT consider myself
"mature" (ask ANYONE who knows me! :>) However, I do feel that
innacurate information, distributed to unconcerned people, in a
crowd, does nothing good but fester. Sorry to disagree, just my
opinion. (I know what they're like.)

It means pretty much what it says. The article you wanted to see
was either cancelled (by its author or someone else) or it was
too old and has been deleted from your news server. A lot of
traffic goes through that server and it can only store so much!

Motorola sells a 12 Kbs digital encryption called "Securenet" and a 9.6 Kbs
digital system that can optionally be encrypted called "Astro."
Aftermarket analog products are available from several manufacturers that
can be used on Motorola radios. Listening on a scanner, Securenet sounds
like white noise. Astro sounds like a buzz.

I received my OS456 yesterday. I ordered it about two weeks ago. It came without the video tape. Also, there was no manual describing the operation of the software, only the instructions on how to install the hardware.

I haven't been able to look at the software yet. I do not have a PC compatible
computer. I was disappointed to learn that the software wasn't the complete version and that I would have to spend another $75 for the full version.

Is anybody working on Macintosh software for this interface?

Please, don't tell me to buy a _real_ computer!

6077. What's the cellular attraction?

Newsgroup: rec.radio.scanner
Date: 1994-07-08 00:11:49 UTC
From: cgwh@chevron.com
Message-ID: <cgwh.22.001232F7@chevron.com>
Source record: 272026

I just recently started watching and contributing to this group and have some questions about a good portion of the discussions.

What is the big attraction on the cellular channels?

Before anyone decides to flame me... I happen to think that the new laws "restricting" cellular monitoring are a farse and fly in the face of basic principles of the telecommunications act of 1934. What the new laws try to accomplish, the act already addressed. If cellular phone users think that no can eavesdrop on them anymore jsut because it's "illegal" they should be told how ignorant they are. So go ahead and listen. Just don't disclose what you hear to anyone. And don't use what hear for your personal (or anyone else's) gain.

But what are you listening to? Listening to police and fire channels gives you an insight as to what's going on in your area. Listening to aviation frequencies can be educating (especially to someone like me). Listening to business channels gets old unless your trying to keep track of someone. But nothing gets as boring, as fast, as listening to everyday phone calls.

To me it would be like going around my neighborhood and looking into peoples' windows. I would usually expect to see people going about their normal boring routines. But once in a while I might see something "interesting". What if I see someone doing something illegal? Do I call the cops and tell them what I saw? Maybe, but isn't it wrong for me to dislose things that I observed that were none of my business?

I would offer that there is reasonable expectation to certain level of privacy by a cellular phone user. However, maybe not the same level of privacy that he or she would expect on a "landline" phone. No one should get in trouble for listening to a cellular call if their just listening
The cell phone users and carriers don't own the spectrum when it comes to receivers. But they do own the content of their signals and no one else has the right to use it without permission. Just like any other radio transmissions you might be monitoring. This was already illegal.

Enough of my legal critisism and bad analogies. But what is the fascination with phone calls that keep people wanting to know how to mod scanners, TVs, telephones and whatever else just to listen in to this stuff?

I will now put on my asbestos underwear and wait for reponses.

In article <2vh5v9$1sm@strauss.udel.edu>, kmorrill@strauss.udel.edu (Kenneth J Morrill) writes:

>How can I send output intended for my printer into my computer instead?

The easist way is to use a parallel-to-serial converter. They cost about $60-70 from most of the major computer supply companies (IE Global). You plug the M-400 via a printer cable into the converter then plug the converter into a serial RS-232 port on the computer. With the M-400 configuring the port for 9600 Baud is fast enough. I use Procomm Plus but any terminal (smart or dumb) program or stand alone communication terminal will work. Only mode that you can't do much with is the FAX mode. You would have to write some code to decode the EPSON printer graphics format binary data and somehow display it. Although I have not tried every mode the M-400 has with my setup I have tried all the VHF type modes and it works great.

Im not sure what Delta's official policy is. However, on a flight from chicago to orlando <727> I had my Pro-43 out and was listening via headphones. Eventually an alert stewardess noticed that i was using this black box with an antenna on it. Im sure she thought it was a tranciever. Anyhow she became shaken and asked me to turn it off. I complied immediately of course, but explained to her that it was only a reciever, and suggested that she talk to someone in the cockpit about its use. She left and returned with the captain's blessing and the freq. that the flight was using for coms.

I didnt scan the cellular freqs. while in the airplane being illegal and all, but if i had, it might have been interesting.

6083. Bob Grove - Wrong Again?

Newsgroup: rec.radio.scanner

Source record: 272030

Whats with Bob Grove? His latest Monitoring Times (overpriced) magazine (July) has a full page ad for the 2006 that states "One of the most renowned scanners of all time is now being produced without the ability to be restored to full coverage. All our current stock is still restorable to full coverage. Don't miss this opportunity".

What is he talking about? I have not heard anything about a non-restorable 2006 as it is being phased out to probably be replaced by the 1000 channel PRO-2035 (20-460) that should appear on the shelves in the near future.

If I find his statment to be false, I am thinking of dumping my subscription. I don't need misinformation just to spur sales.

The above opinions are mine, not those of LLNL.

Beats me. Hearing the "working girls" was amusing the first few times. Several times I heard detectives and Police NCOs. The other stuff is crap.

Nothing beats the cops / fire / ambulance. If you just gotta monitor phone calls, I say it's easier and better to listen to the cordless (46 MHz) ones.

Note to non-hams (like me): for a free education, try the ham bands!

>somewhere with this information? Thanks!

There is one thing, just one, that a person can do to get a thorough education on this question.

Read the article titled "Don't Touch That Dial: Radio Listening Under the Electronic Communications Privacy Act of 1986" by Fred Jay Meyer, in the May 1988 issue of the New York University Law Review (Volume 63, Number 2). A good university or law library should have this.

More than anything else ever widely published on the cellular listening law, and more than a thousand diatribes on the Net, this one article provides the most complete account of what actually happened and how to avoid untoward effects. I was present during the beginning, middle and end of the ECPA circus. I assure you Meyer is telling it like it is.

>PD/FD/SO for the bigger cities along the way it would be gravy.
>
Some info on the railroad(s):

From San Jose to Santa Clara (CALTRAIN):
dispatcher: AMTRAK Control - 160.815 Mhz
railroad West - MP46.9 - MP44.3
talking detector - none

From Santa Clara to Newark (SP Mulford Line)
dispatcher: WR50 - 160.320 Mhz
railroad West - MP44.6 - MP30.6
talking detector - MP33.2

From Newark to Niles (SP Tracy Line)
dispatcher: WR50 - 160.320 Mhz
railroad East - MP37.2 - MP42.4
talking detector - MP39.4

From Niles to Elmhurst (SP Hayward Line)
dispatcher: WR50 - 160.320 Mhz
railroad West - MP29.6 - MP13.4
talking detector - MP28.0

From Elmhurst to Oakland (SP Mulford Line)
dispatcher: WR50 - 160.320 Mhz
railroad West - MP13.4 - MP3.9
talking detector - MP12.4

From Oakland to Sacramento (SP Sacramento Line)
dispatcher: WR49 - 161.550 Mhz
railroad East - MP5.5 - MP89.0
talking detectors - MP23.4, MP34.3, MP45.0, MP68.5, MP70.1, MP78.7
Sacramento River drawbridge MP88.5: 156.650 Mhz

SP PBX channels: 160.890 Mhz, 160.950 Mhz, 161.220 Mhz
SP Police: 161.400 Mhz
CALTRAIN Police: 161.005 Mhz
Freight train Flashing-Rear-End-Device (FRED): 457.9375 Mhz
(about 2 mile range, 5-20 second data bursts)

My info on the detector locations may be dated. All detectors announce "defects" on the road channel after the train has passed. Some detectors announce train speed, number of axles and temerature. All of the routes listed above are CTC (Centralized Traffic Control); authority to occupy tracks is given by signals, no radio/voice is necessary. There may be some communications with the dispatcher about delays and speed restrictions. BTW, there are 110-volt AC outlets on each end of the cars.

242.4 MHz (AM) and 47 MHz (FM) are used all the time by
the Army/National Guard helicopters flying over northern
Illinois. Listen on the weekends. That's when there's Guard duty.

I have other freqs but don't know what you were interested in...
army? air force? .....

It helps if you live near a military base, e.g., Glenview NAS,
Scott AFB, etc. There's an Army repeater on 148.6 FM used on
the weekends in Elwood (near Joliet), but it's a small time
operation used on the firing ranges.

>Are there any Mods for the BC700A?

Yes. Cellular can be restored.

CELLULAR RESTORATION:

1. Remove the screws holding the case halves; separate them using care to unplug the speaker lead.
2. Turn the scanner upside-down with the face away from you.
3. Remove the two side screws holding the faceplate; tilt it forward.
4. Find the transparent cable. Using a jewelers screwdriver; CAREFULLY pry up and unplug the cable so that the faceplat can be tilted fully forward.
5. Locate the copper/plastic shield under the faceplate; unsolder and remove it.
6. Remove the resistor marked "472"
7. This complete the modification. Plug the cable back in place and test the scanner by entering 870.000 (channel spacing will be 12.5 kHz; not 30 kHz.
8. Reassemble the scanner.

Note: I have not verified this modification. Proceed at your own risk.

|> Just my opinion (certainly NOT that of Tandy Corp.!)
|>
|> John

My experiences with local radio shacks have been mostly good. On Field Day, one manager supplied over $200 worth of merchandise to keep our club's station running smoothly. Items provided included cables, adapters, headphones, push-up masts, etc. This was brand-new stuff off his store's shelves. The manager _ate_ the cost of this equipment, since after we used it it was not salable. Needless to say, he gets my business whenever a high-ticket item is to be bought.

Yes, Radio Shack has hired quite a few bozos as salespeople. I note that is less common now that they are carrying ham gear. Most stores want to have someone on staff who can demo the ham rigs so that makes it pretty likely that there will be at least one or two hams working at a store. I also note their recent ad campaign that emphasizes the know-how of their employees. If this campaign represents Tandy's true intent, the days of the bozos are numbered.

Employee competency is becoming much more important. As an example, look at the rapid growth of Home Depot stores. Their policy it to hire people experienced in the use of the items they sell and to pay them fairly. The arrival of Home Depot in our area spelled the demise of other hardware chains that hired "stock-boys" and paid minimum wage. The surviving competition are the stores that have matched Home Depot's standard for employee competency. Perhaps Radio Shack needs some competition!

Source record: 272048

Nope, I'm nothing at all to do with those folk other that I bought their Northeast edition of the FCC data on CD-ROM.

Personally, for all its' shortcomings, I love the thing. Much more information than is to be found in book format.

Pro - Packed with information

Con - The search engine provided on the CD has more bugs than the American embassy in Moscow.

The export format is fine, except that the four numeric fields in each record (other 57 are character type) can't be properly exported.

Rating - 9 out of a possible 10. The usefulness of this thing far outweighs the annoyances.

Buy it, then export the stuff you're interested in to the database of your choice.

(BTW, the four non usable fields are not critical ones...)

I have heard that one can replace a xtal in order to hasten the speed of scanning. Unfortunatly this was all I heard. I am interested in this mod. If anyone has such directions please post or email them to me. I have already cut two restrictive diodes to enable full coverage and slightly faster scan speed.
Thank you much for your information.

There is no reason to do the mod! Just hold down 2, 9, L/O while
powering up thee radio. Scan down to the last feq just before the
radio jjumps into one of its "normal" bands and store it in a memory
location. Start with location 23 after the power up. It will be in
a "forbidden" zone.

I keep on seeing references to a magazine called Nuts and Volts, but
I havent' been able to find it. Can someone tell me where to
find a copy in the San Francisco/East Bay area?

Thanks!

" AT>
"
" Hi, Allen...I just read on another net that if you have the letter 'A'
"before your serial number, the unit cannot be modified. Is this the case?

Yup, that's true. I'd like to thank everyone who responded
to my initial post by posting or through email!

I went back to Radio Shack and told them that I wanted to return
my Pro43 because it can't be modified for cellular. They told me that
they already knew of the problem because some people have already
complaied abut the models with the "A" FCC id and the "A" serial number.
They called a couple other radio shack stores in the area and finally
found one that had a new, in-the-box modifiable Pro43. I went
to that store and they let me swap.

If you're in the market for a scanner, you'd better get it NOW!
Most radio shacks are OUT of modifiable Pro43's (I checked 5 RS in
San Francisco and Berkeley). Of those 5 stores, one had one in the box,
and another only had a demo unit. I hear that most mail order outlets
are also fresh out of modifiable Pro43's....

BTW - I don't really care about the cellular anyway. I'm just making a big
deal over it because it's supposedly illegal. If the FCC didn't care
about it, I doubt I would either...

Allen

From: sullivk@cie-2.uoregon.edu
Message-ID: <2vkkt0$su3@pith.uoregon.edu>
Source record: 272058

Hello everyone,

I'm new to the world of scanners and I heard mention of the Uniden BC 760XLT scanner on the Art Bell AM radio show, he said that though it was an older model that it was an excellent value for $269.95 from C. Crane and Co. (a mailorder outfit in CA) he went on to say that this unit could receive the now blocked portion of the 800MHz band.

On impulse I purchased one ... *gulp*. Was I lucky to find one on sale or have I made a terrible mistake? :-) Any information, opinions or anecdotes about this particular model scanner would be welcome. Thanks

>channel in this area (Oakland Center, I believe).

>It's amusing to scan the marine band and hear conversations about
>flight levels and localizers. The reception is surprisingly good,
>considering that the marine band is FM but aviation is AM.

You're right. 135.4 was the first thing that popped into my head when I was thinking of the example. 135.4 is a freq for Bay Approach. They provide terminal radar service for bay area airports.

As far as the reception goes, I imagine you have no trouble hearing it but the audio level might be slightly reduced. AM (with both sidebands as opposed to SSB) has some FM characteristics. And the limiting ability of some scanners maybe questionable.

I should have also mentioned that whether you add or subract the magic number (two times the IF) depends on whether your local oscillator is generating high or low injection. Since you hear 135.4 on 156.8 your injection must be 10.7 MHz low or 146.1.

>from the anti-mobile-scanner laws? Is it a federal or state law. I'm in CA
>and would like to have a copy of the law in case any difficulties arise.

There is no law against the mobile use of scanners in California unless you are using it to commit a crime and avoid detection. So it's illegal to use it to get away with intentionally speeding by keeping track of police whereabouts. Technically, this should also apply to radar detectors but it's hard to prove.

I think the scanner law that you are thinking of was back east somewhere. I want to say Connecticuit but I am not sure. I also beleive that it applied to amateur equipment in the possesion of licensed amateurs, not just Joe Anyone that bought a mobile ham rig.

Someone correct me if I am wrong.

Actually, I'd say the FCC ID tells the story! The ' A' at the end is new,
indicating a new improved FCC approval!

Also note the "number" in the S/N seems to have been reset somewhat.

Anyway, the arrow does tell a sad story.

: house. I understand that this is done by criminals and they piggyback onto a
: subscribers bill without his knowledge. I want to do basically the same
: thing, but I would be paying for the second phone's calls.

Yes, this can definately be done. It depends upon the Cellphone as to how
easy it actually is. Motorola, Tandy, Nokia and Panasonic do not require
an e-prom programmer. Most of the others do. Most Boneheads will tell
you that this is illegal. No one in the FCC has ever heard of such a law.

: Can a cell phone be made to act as a scanner and receive other
: traffic on the frequency? Seems to me if I could make the phone just monitor
: the different channels, I could use it like a receiver.

Not a scanner as this group would suggest. Actually a manual one where
you have to change each and every channel reguardless if it has something
being received or not.

BUT, that is the usual reason cited by the marketing GEniuses from the
trunking coMpanies. It is also the reason most often given by officials for
needing to spend all that money on a new radio system.

>Several times I heard detectives and Police NCOs. The other stuff is crap.

Also, you get to hear people calling the psychic friends network, and other
900/976 numbers without the x$/minute charge (hmmm is this 'profitting' off
of what you're hearing?)

>Nothing beats the cops / fire / ambulance. If you just gotta monitor
>phone calls, I say it's easier and better to listen to the cordless
>(46 MHz) ones.

If listening to phone calls is your dig, cellular's got way more than
cordless.

>Note to non-hams (like me): for a free education, try the ham bands!

Definitely! This is what led to me getting my license!

Note: none of what I said should be construed to imply that I listen to
anything I'm not allowed to. The stuff mentioned above was heard coming out
of some guy's scanner for sale at a local swap meet.

All anti-scanner laws translate to "You can't listen to a radio". Such laws
are very scary and remind me of dictatorship countries who have only stronger
versions of these laws. Pretty soon, some congressman will ask, "Why should
ordinary folk be listening to the police?" Scary indeed. What band segment
will be next? Am I on the feds 'dangerous' list yet?

No offense Jim, but you've obviously never heard of the Electronic Communications Privacy Act of 1986 (ECPA). It makes (made) it illegal to monitor cellular phone calls in any way, shape, or form, and by any method, unless you are a law enforcement officer with proper authorizations, or an employee of the phone company involved, and such monitoring is necessary in the normal course of your job.

And I guess I better insert here that the ECPA applies to the United States only.

If you need a copy of the ECPA, email me and I'll email a copy to you (that offer is open to anyone else who needs it too). Let me know if you can handle the zipped and uuencoded version, or if you need the plain-text version (and if you need this one tell me if you have problems with an email message that is 100k long).

: >

: Actually, I'd say the FCC ID tells the story! The ' A' at the end is new,
: indicating a new improved FCC approval!

: Also note the "number" in the S/N seems to have been reset somewhat.

: Anyway, the arrow does tell a sad story.

We are making more assumptions here, again, aren't we?

Before anyone starts passing around stories that the 20-300A units
can not be modified, someone needs to look at the diodes in the
20-300 model and compare that section to the 20-300A units. Such
as perhaps if the processor/ROM was not changed, the diode was
mapped to another section of the board.

Also a comparison needs to be done between where the traces of the
old units go from the diode and where the traces of the new ones go,
or don't go. And if they don't exist, what happens if a diode is
placed between the two points where one used to be used? I mean they
may have inverted the logic, and require the diode present for
cellular, this means they would have a chip usable internationally as
well as domestically. On the Pro-43, was it add the diode or remove
the diode? I thought it was MOVE the diode, and the new location
opened up 54-88 mhz. What happened to this section of the spectrum?
Ie how many diodes are there or locations for them now?

Now, add to this a printed circuit board without any place to connect
the diode, specifically made for U.S. sales. Since there is no place
to add the component or remove the component, it would meet the letter
of the law, AND keep the production costs down by using one CPU for

both markets.

If this is true, it should be possible to use a 1N4148 or 1N914 diode between where the diode was connected in the old units using the same locations in the new units. I guess until we can get some input from an international service facility, or someone has the benefit of both types (old and new) we won't know. But I know they would not sell many units internationally without the cellular capability being restorable, and its not econimically practical to make TWO different CPUs/Roms to be used in the two markets. I mean its obviously should be possible to change the new CPU/Rom for the old version, obtained with intention of installing in international version. Has anyone asked any manufacturer if this will work? Costs? Parts?

I know my next unit will be from Canada or overseas just to avoid all this sh*t and aggrivation. I will NOT buy another scanner from a U.S. dealer UNLESS it is easily modifiable or comes with cellular.

I am surprised no-one has done so yet. If I needed another scanner (I have five as it is), I would do this research myself, and use the 30 day return policy that all Radio Shacks have to return it if I could not find a way to restore it. That is a suggestion for anyone interested. Just make sure you are careful and that it still works when you have finished your modifications in an attempt to restore the cellular. Better yet, even if your mods kill the thing, you can still take it back and exchange it for a working model (duh, it quit working) as long as it does not LOOK like it was opened and messed with.

We need some experimenters to start work on this beast. I do not think it has made it to my area yet...

Subj: PRO-51 cellular trick Section: VHF/UHF Scanning
From: Howard Bornstein 76174,637 # 273839, 1 Reply
To: All Date: 02-Jun-94 05:47

There is an interesting test mode in the PRO-51 that, combined with the
direct search feature of the scanner, lets you pick up out-of-band
frequencies. You will have full access to the 66-88 Mhz ranges as well as
the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these
comments should be true for any Uniden-made Radio Shack scanner, such as
the PRO-46). I'll describe them first and then how to take advantage of
one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any
frequencies you had programmed into your scanner, so it's best to use
these techniques before you program your scanner. If you have already
programmed it, you'll have to decide if these new capabilities are worth
reprogramming.

Test mode 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down
the 2 key, the 9 key, and turn on the scanner. All frequencies will be
lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00,
109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnotic mode.

Display Test Mode.

Press 2, 9, Band or 2, 9, Moni.

This put the display in test mode. Every annunciator and every digit element is turned on in a scan from the left side of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked out 66-88 Mhz range, and channel 23 holds

a frequency in the blocked out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in these channels. You can move them to any channel in the scanner. First move them to a monitor channel.

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner.

Enter the channel number
Press PROG
Press Monitor
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 audio fall within the 66-88 Mhz range, yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide band FM mode for proper reception.

I'd be interested in anyone can verify that any of these test modes work on the PRO-46 or any other Uniden-made Radio Shack scanner.

M2> the frequency?

Hi, Rudy...
The Uniden Bearcat 8500 (soon to be discontinued) has alpha-numeric capability. It is only available in the first 250 of the 500 channel base unit. This unit was plagued with problems and has not been recommended by anyone that I know of. No word on a replacement for this unit as of yet from Uniden.

I find cellular conversations boring for the most part as well. But several agencies will use this as a back door to communicate with a dispatch center or a hospital. Of course, what I hear remains within the confines of my mind. So I will switch to these when someone on the public safety channes says "Call me on the carphone."

6160. Scanner for Sale (Pro-51)

Newsgroup: rec.radio.scanner
Date: 1994-07-09 23:29:15 UTC
From: cravitma@cps.msu.edu
Message-ID: <2vnbsb$1043@msuinfo.cl.msu.edu>
Source record: 272005
Cross-posted to: rec.radio.swap,rec.radio.scanner

I have a scanner for sale. It is a Radio shack Pro-51, which has the following features (these are the important ones anyway):

- Tunes 29-54,118-174,380-512,800 MHz (excludes cellular, not sure if it is mod'able)
- 200 channels in 10 banks + 10 "monitor" channels
- 2-button scanning of Air, Marine, Weather or Fire frequencies
- Lockout, priority, keyboard lock, search between limits
- Light on display
- Quite small and light

Comes with manual and antenna. The radio is about 5 months old, and I am selling it 'cause I need the money, not 'cause I am in any way unhappy with it.

Paid ~$299.99 + tax. I am asking $225 + 1/2 shipping, OBO (reasonable offers only). Very good condition, small amount of fine scratching on the display, but this does not in any way affect the use of the radio. The scratches are less than 0.25mm wide, and none are very long. I will ship the scanner UPS or FedEx COD, whichever turns out to be cheaper.

If interested, please reply by e-mail (cravitma@cps.msu.edu)

/Matthew

In article <cgwh.22.001232F7@chevron.com>, cgwh@chevron.com (Curtis Wheeler) writes:
> What is the big attraction on the cellular channels?

I would guess three things, from what I've heard told:
(1) The lure of forbidden fruit.
(2) The fact that there's always something there, even in communities where
othere utility services are relatively quiet.
(3) The same sort of appeal as soap operas. A glimpse into people's lives
that may be interesting in a gossipy kind of way, with the knowledge that
little if anything will be resolved and that the "story line" may cut away
before anything significant happens . . . but always with the potential
for something out of the ordinary (e.g., I heard about a conversation
between a husband and wife to purjure her court testimony to keep him out
of jail).

I think the question is a fair one, but the answer is the same as that to "Why
watch soap operas?" Some people find them enjoyable; many find them a
complete waste of time. There's no right answer, just different perspectives.

I'm waiting for the anti-monitoring provisions of the ECPA to be repealed so
that I can judge for myself. With my luck, the repeal will take place just as
everything gets converted to digital (which is why, at the April 26 deadline,
I *didn't* plunk down $1400 for a 7100) so I'll *never* know for sure.

6163. OPTOSCAN 456

Newsgroup: rec.radio.scanner
Date: 1994-07-10 00:56:00 UTC
From: jthomas@hookup.net
Message-ID: <jthomas.10.2E1F4720@hookup.net>
Source record: 272007

I was wondering if other people out there are having any trouble with the software that came with it.

My trouble is that it is not reading certain frequencies in search or memory mode! The frequency I'm having trouble with the most is 142.935, witch happens to be the local police department.

138-142 is where all our law enforcment frequencies are and have not had any luck with them either.

I had no trouble installing the hardware took about 40 min. Any information would be helpfull.

: > Enough of my legal critisism and bad analogies. But what is the fascination
: > with phone calls that keep people wanting to know how to mod scanners, TVs,
: > telephones and whatever else just to listen in to this stuff?
: Beats me. Hearing the "working girls" was amusing the first few times.
: Several times I heard detectives and Police NCOs. The other stuff is crap.

: Nothing beats the cops / fire / ambulance. If you just gotta monitor
: phone calls, I say it's easier and better to listen to the cordless
: (46 MHz) ones.

: Note to non-hams (like me): for a free education, try the ham bands!

Well looks like its time for my $1 worth, I'll try and make it cheap:

It is not so much the fascination and or regular entertainment you can
get (ie, the working girls, the confidential calls the cops make on
their cellular thinking its "secure", or the drug deals that go on)
that causes an interest to do so... its the "ability" and "capability"
to do so when the need or interest arises.

I'll admit, my cellular listening is around 1 hour per month, usually
when there is nothing else going on.

But, there is a freedom of the airwaves that needs to be protected,
and there should be no radio frequency "protected" to the extent you
can not readily obtain equipment to monitor it.

If they want privacy, there are digital methods to do so. But when they
expect their signals to get free passage through my property, then
I have a right to possess equipment to monitor those signals passing
through. I mean, heck, I could make a limited range but strong signal
to intentionally interfere and block cellular signals from entering or
exiting my property, to basically prevent them for going through.

If others did the same, then maybe the cellular guys might understand,
if they want passage, either we get to possess equipment to make sure
what's passing is legal (for example -- not obscene or pornographic),
or it does not pass.

I mean, why shouldn't cellular be monitored and the same rules which
affect any other broadcast signal be placed upon them??? I mean they
ARE broadcasting... anyhow, I got off topic...

It's not so much the interest of doing this on a regular basis for
a person's pleasure as it is to having the capability and freedom
to do so when conditions make it entertaining to do so.

To h*ll with the law, I think those who know me, by now know my
views on it, I totally ignore it.

Freedom in this instance relates to having readily available equipment
to do so. Supposedly the U.S. is the Land of the Free... Well I think
that should be the Land of the Restricted.

If you want privacy, DON'T use a device with an antenna!!

: >What is the big attraction on the cellular channels?

: It's because it's the only chunk of bandwidth that's restricted. It's
: sort of like what happens in the movies when a theater yanks a picture on
: moral grounds (remember "Caligula"?). Even though it may be trash,
: EVERYBODY wants to see it then....

I am in ONE HUNDRED PERCENT AGREEMENT with that!!

Like I said in another post, I average 1 hour a month of cellular.
That's like 15 minutes in a week, under three minutes a day. The
actual math is around 15 minutes four times a month. For example:

I am driving down the highway, this IDIOT is swerving all over the
highway with his ear to his cellular phone and one hand on the
wheel. Well.. this must be an interesting conversation to make him
take is concentration off what he is doing... so its time to find
out what is causing this hazardous condition... on goes the scanner,
and the button labeled search is depressed, on the lower cell phone
segment... looking for a nice STRONG signal. Aha.. locked in. Now,
what's this... the wife is saying she want a DIVORCE? Oh ho.. Now
I see... must have been that late friday night at the office made
her feel forgotten... aha... that explains his poor attempt at
keeping on the road... ok, off with scanner. Answer found.

Oh, the scanner is in Florida. Sits on the car seat in top of the
briefcase. Uses rechargable batteries and an antenna clipped on
the window. No law broken with scanner in vehicle as the law is
quite specific. It states "installed" in a vehicle. A handheld
is NOT installed and a window clip is not considered installed either.
Installation is further defined as using vehicle power and antenna.
Well it's not using a vehicle antenna, as its a telescopic 4 foot
portable. No vehicle power. Meets the exception quite well :-)

>>
>Some info on the railroad(s):

***** Lots of frequencies and info deleted******************

If you are a real serious rail fan/scanner user you need to get
California Regional Timetable #5, current edition. It lists each railroad
in the state with mile post data, defect scanners, rosters and complete
lists of all frequencies in use. About $16.50 at a model rail
road store or direct from Altamont Press,po box 754, Modesto CA
95353-0754. I get a new one once a year.

They also put out timetables for the: Pacific Northwest Region, Southwest
Region, both $11.25, Rocky Mountain Region, $14.50 and Intermountain, $13.25.
Plus Calif. sales tax and postage which I don't know.

Format is 10.5 x 4 inches, just like the prototype, with stiff card
covers. Buy one for your area once and I guarantee that you will buy one
a year and maybe an extra for the glove box. I had one of the first ones
on Amtrak once and wrote Altamont's address for two of the train
crew.

: : A little homophobic, Timmy?
:
: He's NOT the only one... Like I said in the oj simpson fan newsgroup
: where someone suggested Goldman was gay -- That was no major loss to
: society. But Nicole, that's different.

Yeah, it's too bad there are so many narrow-minded people in the world.

: There is no place for these immoral unneeded people with personal
: problems (where they forgot if they were male or female) especially
: THIS newsgroup.

Who are you, or I, to determine what is "moral" for other people. That is
a personal value judgement, usually based on religion. By the way, I doubt
if the gays have any doubt as to their sex.

: They do not belong in ANY newsgroup except for those containing the
: words gay, lez or bisex.

I agree that the posting does not belong here. So, complain to the
postmaster at the posting site.

: Ask someone who is gay how they plan to reproduce. (snicker) I
: suspect the answer will be most interesting.

What does it matter if they can or not? That is none of our business, just
as it is none of our business if married people choose to not have children.

They are human, like you and I are. Their sexual orientation does not change
that in the least.

Bill

Does anyone know anthing about the Regency HX-1000 model scanner?>
I have a unit that programs fine, and scans, but does not recieve.
It also does not stop when it recieves a carrier. Any hints, info,
manufacture address, etc. would be greatly appreciated.

I agree. A place for everything and everything in its place.

However, it is *quite* un-necessary to post a rhetort which slams
someone due to their beliefs/et cetera.

The original post was in the wrong place.
The responses showed a severe lack of maturity.

The poster of the advertisement needs to learn net-discretion.
The follow-up-perns need to learn a bit about tolerance and
etiquette.

Gee, fellas, courtesy *is* contagious.

Then...don't use them!

If you're not interested, don't read the article.

Some people want to listen for the hell of it. Others may want to
listen as a laugh.

Why do some folks want the frequencies to NORAD? What do they have
to say that's so exciting?

Or, freqs to .... gasp .... city maintenance crews!!!!

Yes, dig those holes. Fill that ditch. Salt/sand the roads.
Weeeee-hoooo.

: Anyway, the arrow does tell a sad story.

SB> We are making more assumptions here, again, aren't we?

It is a safe assumption, isn't it? :)

SB> Before anyone starts passing around stories that the 20-300A units
SB> can not be modified, someone needs to look at the diodes in the
SB> 20-300 model and compare that section to the 20-300A units. Such
SB> as perhaps if the processor/ROM was not changed, the diode was
SB> mapped to another section of the board.

Word on CompuServe Hamnet is that the diode matrix is not the same as the
original 20-300 models.

SB> placed between the two points where one used to be used? I mean they
SB> may have inverted the logic, and require the diode present for
SB> cellular, this means they would have a chip usable internationally as
SB> well as domestically. On the Pro-43, was it add the diode or remove

I have thought of that. I am waiting for someone on CompuServe to make the plunge into the new unit to find out. Bill Cheek, the scanner guru of mods, may be able to come up with something. In the meantime, I guess we're going to have to wait for someone who's got money to buy the latest '43 to make the plunge into reverse engineering.

If you want, you can buy me a non-modifiable '43...I'll be happy to check it out. <bg>

The points you have made are well taken, Stephen.

6185. draft version, faq, pagers

Newsgroup: rec.radio.scanner
Date: 1994-07-10 18:44:56 UTC
From: dannyb@panix.com
Message-ID: <2vpfj8$60o@panix.com>
Source record: 272023

suggestions for further inclusions cheerfully accepted...
Pager FAQ

Danny Burstein <dannyb@panix.com>

Version 0.5, 10 July, 1994

This FAQ has been put together to answer some of the
more common questions about pager systems. It is primarily
focused on the US and Canadian arrangements, but other
countries are not forgotten.

Updated info or suggestions for further additions should
be emailed to the above address.

1) What is a pager anyway?

As usually described, a pager is a portable unit, generally
about half the size of an audio cassette box, which can
be signalled to send a one way message to the pager owner.

2) What types of messages?

The earliest units, usually called beepers, simply gave
a tone alert. This was a signal to the wearer to, for
example, call the answering service.

The next step was units which could display numbers. While
the most common use is to send it the phone number you want
the person to call, you can, of course, add code numbers
to mean anything else you'd want.

For example, the number xxx-yyyy-1 might mean
to call the xxx-yyyy number at your leisure. Xxx-yyyy-9
might mean call ASAP.

The most recent units, called alpha-numerics, display
complete written messages. So, for example, the pager could
show the message: "please call home, you have a letter from
the IRS."

There are also -voice- pagers which will let you actually speak
into the phone and have it come out the person's pager. These
are pretty rare.

3) How are messages sent to the pager?

by radio. Well, it's a bit more complicated than that. Let's
take a look at how a pager actually works:

The pager is a small sized radio receiver which constantly
monitors a specific radio frequency dedicated to pager use.
It remains silent until it 'hears' a specific ID string
which tells it to, in effect, turn on, and then listen up for,
and display, the forthcoming message.

(again that could be a numeric or other string)

This ID is called (in the US) a CAPCODE. It has -nothing-
to do with the phone number you call or the ID you give
to the page operator (see below).

So the key point is that the pager company radio transmitter
is constantly sending out pages, and your specific unit will
only activate when it hears its ID/CAPCODE over the air.

4) How do I send out the message?

This depends on your pager vendor. Let's take the most common
examples:

a) Alert tone only (the old style)

You call up a phone number assigned to the pager. You'll hear
some ringing, then a signal tone. At that point you hang up.

Shortly afterwards the pager transmitter will send out the
individual unit's capcode and it will go off.

b) Touch tone entry: You will call a phone number
dedicated to the specific pager. It will ring, then you'll
hear a signal tone. At that point you punch in, using touch tone,
the number you want displayed on the pager.

A few seconds later the transmitter will kick out the
pager's capcode, followed by the numbers you punched in. Then
the pager will give its annoying alert tone, the person will read
it, and call you back.

(note that there is a variation on this in which an entire
group of pagers has the same phone number. You call it up, then
punch in the pager's id number, and continue as above)

c) alpha-numeric: With this one there are various ways
of getting the message to the system.

i) via an operator: The pager company will have you
dial up their operator. When they answer, you give them the
pager id number and the message. They'll type it into the
computer and shortly afterwards the transmitter will send
out the capcode and the message

ii) using -your- computer: Most pager companies with
alphanumeric have a dial-up number you can call yourself.
Some of these will work with regular @comm programs, while
others require proprietary software.

The most common method is to have your computer dial
up the number, then you type in the pager ID, followed
by the message. Again, a moment later, the system will
transmit it over the air, etc. (There are also various
software packages that automate some of this)

iii) special terminals: Because of the popularity of this
type of system, there are various stand-alone terminals
specifically designed for this purpose. The most common one
is the Alphamate (tm Motorola) and it automates
many of the functions. It's basically a half-decent keyboard
with a two line display, and is preprogrammed with the
phone number of the company, etc.

5) My company has given us pagers, and I notice that I have
both an individual ID and a "group" number. When we page
out to the group, everyone's unit goes off. How does this work?

Remember that a pager is basically a radio receiver that is
constantly monitoring for its capcode. You can get pagers which
monitor more than one id. In this case (which is quite common)
your personal capcode might be yyyy, while your boss's might
be yyzz. In addition, both pagers will be listening for the
capcode zzzz.

When zzzz is detected, all the pagers with that capcode will
go off.

6) I keep hearing about sports or news services available
by pager. How do they work?

Keep in mind that pagers work by constantly monitoring
the radio channel for their capcode. So if you have
ten pagers, or a hundred, or a thousand, all with the same
capcode, they will -all- go off at the same time.

This way the sports news company sends out one message
and it gets displayed by all subscribers.

7) So if I find one of these sports-news pagers on the
sidewalk I can use it for free?

Umm, kind of. As long as the company providing the service
keeps using the same group code, your pager -will- continue to
